Founded in 1963 by two prominent Austrians living in exile – the sociologist Paul F. Lazarsfeld and the economist Oskar Morgenstern – with the financial support from the Ford Foundation, the Austrian Federal Ministry of Education, and the City of Vienna, the Institute for Advanced Studies (IHS) is the first institution for postgraduate education and research in economics and the social sciences in Austria. The **Political Science Series** presents research done at the Department of Political Science and aims to share “work in progress” before formal publication. It includes papers by the Department’s teaching and research staff, visiting professors, graduate students, visiting fellows, and invited participants in seminars, workshops, and conferences. As usual, authors bear full responsibility for the content of their contributions.

Das Institut für Höhere Studien (IHS) wurde im Jahr 1963 von zwei prominenten Exilösterreichern – dem Soziologen Paul F. Lazarsfeld und dem Ökonomen Oskar Morgenstern – mit Hilfe der Ford-Stiftung, des Österreichischen Bundesministeriums für Unterricht und der Stadt Wien gegründet und ist somit die erste nachuniversitäre Lehr- und Forschungsstätte für die Sozial- und Wirtschaftswissenschaften in Österreich. Die **Reihe Politikwissenschaft** bietet Einblick in die Forschungsarbeit der Abteilung für Politikwissenschaft und verfolgt das Ziel, abteilungsinterne Diskussionsbeiträge einer breiteren fachinternen Öffentlichkeit zugänglich zu machen. Die inhaltliche Verantwortung für die veröffentlichten Beiträge liegt bei den Autoren und Autorinnen. Gastbeiträge werden als solche gekennzeichnet.

Abstract

This paper addresses the democratically fundamental question of the inclusiveness of electorates and of its impact on citizens' representation. While the literature has focussed on the congruence between voters and representatives, it has neglected congruence issues between citizens and representatives. The paper investigates comparatively this bias and source of newly disenfranchised citizens in a globalised society with increasing mobility. On the one hand, electoral laws vary in their inclusion or exclusion of expatriates (emigrants) and in the right to vote to non-national residents (immigrants). On the other hand, naturalisation laws vary in the maintenance of nationality for expatriates and in their inclusion of non-national residents. We illustrate levels of "discrepancy" between electorate and citizenship in 22 OECD countries qualitatively, by presenting differences of electoral and nationality laws, and quantitatively, by comparing the size of citizenship with that of the electorate, and the national and resident populations. We show that shifts between political and national communities are primarily due to naturalisation laws and that electoral laws have so far been unable to correct for the discrepancy.

I. Introduction

Early studies of forming democratic citizenship have focussed on the progressive inclusion of increasingly large segments of the population in the electorate, what classical sociologists and political scientists called “incorporation” or “participation”.¹ With the full enfranchisement of the adult population and with the consolidation of national membership boundaries of political systems the analytical focus shifted toward Rokkan’s third threshold of democratisation, that is, “representation”. Since then, citizen–representative congruence has been at the heart of the empirical study of the quality of democratic representation, that is the degree to which voters’ preferences are reflected among representatives.² While early studies focused on measures of proportionality, in the last years empirical research has addressed the correspondence between ideological preferences at the electorate level and at the policy-makers level. In this regard, the literature has greatly improved the way in which the congruence between citizens and representatives is measured.³

Yet, the analysis of congruence in representation has been conducted under the assumption that electorates by and large reflect citizens. This assumption could be safely made under circumstances of consolidated national boundaries of political systems. The equation between citizenship and electorate is however increasingly problematic in a globalising society with increasing geographical mobility. The definition of citizenship merely through political rights (the right to vote) is restrictive and does not take into account other elements of citizenship such as social rights (Marshall, 1963) and nationality (Brubaker, 1992). According to a more encompassing view, the electorate is only a subgroup within the citizenry. The assumption of correspondence between citizens and voters – which probably has never been entirely realistic – does certainly not apply to periods of elevated international mobility with life-long immigrants and emigrants transcending generations. The definition of citizenship and electorate under processes of supra-national integration and globalisation is today subject to “restructuring” of boundaries very similar to that of other aspects of social and political life.⁴

Under these conditions, the phrase “no taxation without representation” acquires new scope. An increasing share of citizens living and working outside their countries lose political rights leading to a shift between citizenship and electorate. The claim this paper makes is that *the measurement of citizen–representative congruence cannot be equated with voter–representative congruence and that therefore issues of inclusion should be revisited.* By

¹ Rokkan speaks of incorporation in his model of democratisation based on four thresholds (Rokkan, 1999). Dahl presents a similar model of the first wave of democratisation along the two dimensions of liberalisation and participation (Dahl, 1970). On these processes see also Bendix (1977).

² Accountability has been understood as the other main dimension of democratic representation (see, for example, Mansbridge, 2003; see also Powell, 2000).

³ See Huber and Powell (1994), Powell (2000), Powell and Vanberg (2000), Blais and Bodet (2006), Golder and Stramski (2010).

⁴ For the most systematic treatment of the restructuring of the boundaries of political systems under pressure of supra-national integration see Bartolini (2005).

focussing on the quality of representation of electorates through representatives, the literature has forgotten issues of inclusiveness. It is this gap that the paper aims to fill. By claiming that this discrepancy has a deep impact on the quality of representation, we believe our argument has important implications for future studies on representation. It proposes that representation studies should clarify their understanding of citizenship and operationalise it accordingly, calling for measures of representation against different definitions of citizenship. It thus proposes to focus on the under-representation of entire social groups rather than on the distribution of voters' preferences. In other words, we wish to shift the focus from representation to inclusion.

The paper is organized as follows. First, we elaborate on the notion of citizenship in relation to the electorate and representation. Second, we present a typology of electorates and the potential causes of variations among types. We show that ideal-typically the right to vote can be granted to (1) nationals (including expatriates), (2) residents (including non-nationals), or a combination of both, i.e. (3) resident nationals only or (4) all residents and nationals. Third, we show qualitatively variance in voting rights for non-national residents and national expatriates across 22 countries and, quantitatively, the discrepancy between citizenship and electorates in these countries. The conclusion discusses normatively the relationship between national and political community, and makes a proposal to overcome the shift between citizenship and political rights.

II. Citizenship, Electorates and Representation

The issue of inclusion deals with the relationship between citizenship and electorate. While political rights (the electorate) constitute a crucial dimension of citizenship, the latter concept is broader. We define citizenship as the (potential) *access to social rights that are granted to a group of people either through nationality (which applies to resident nationals and expatriates), or through residency (which applies to national and non-national residents) and, consequently, taxation duties.* In the first case we speak of a *membership principle* (the group of nationals); in the second case we speak of a *territorial principle* (the group of residents). In both cases citizenship is attached to a number of rights (but also duties) which an individual can make use of or claim. This entails a definition of citizenship which does not necessarily correspond to that of the electorate. On the contrary, it is likely that it goes well *beyond* that of the electorate. For example, immigrants have access to social provisions and pay taxes, but do not enjoy political rights. Furthermore, expatriates may profit from welfare provisions (or can always claim them by returning to the country) without enjoying political rights.

In Marshall's (1963) classical formulation citizenship includes civic, political and social rights.⁵ Nationality has been the most important institution for the provision of citizenship rights.⁶ The reception of citizenship rights is, however, only partly dependent on nationality. In particular, civic rights are not bounded to nationality as they have developed towards human rights, which are increasingly granted on a global scale. Above all, social rights only partly depend on nationality as non-national residents in most Western countries get similar social provisions as national residents. The status of non-national residents, which have social but not political rights, has been described as "denizenship" (Hammar, 1990). The concept of citizenship is therefore more encompassing than any operationalisation based on political rights. Political rights that define the electorate include, depending on the countries, a more or less wide proportion of citizens – as broadly defined above as the potential recipients of social rights either based on nationality or residency. There is therefore a varying discrepancy (across countries) between electorate and citizenship with some countries achieving a more or less complete coverage of the citizenship and some countries excluding a more or less large group.

⁵ The nation-state has been, and largely continues to be, the locus of political and social rights. This applies to a lesser extent to civic rights, which have an application across national borders independent of nationality. This is the reason why – as reiterated further down – we focus on the national level as opposed to the local or supra-national ones.

⁶ It has been granted on two principles: ethnicity and residency (Brubaker, 1992). Which principle is dominant depends on conceptions of nationhood (see also Koopmans et al., 2005). While civic conceptions of nationhood foster legal citizenship laws that give nationality dependent on residence (*jus soli*), nationality is according to an ethnic conception of nationhood provided dependent on descent (*jus sanguinis*) (see also Weil, 1984).

The distinction between citizenship and voting rights had little impact on voters–representatives congruence during the peak of the nationalised state. This is because of the strong coincidence of the territorial boundaries (residency) and membership boundaries (nationality) during the peak of nationalisation. The closure of political, cultural, social, and to some degree economic boundaries along the unitary state (Rokkan, 1999; Caramani, 2004) and the following cultural homogenisation (Gellner, 1983) has created a far-reaching congruence of rights and duties along the lines of the “nation-state”. Only recent trends of globalisation and European integration have resulted in a *decoupling of boundaries* along different functional and territorial dimensions. The decoupling of territorial from national boundaries has important consequences. The increase of migration within and between the developed and developing world has had the effect on a growing non-national resident population and on the size of the expatriate community, as well as on the size of the national community through increasing naturalisation rates.

The decoupling also affects the composition of electorates. This is because electoral rights are usually connected to nationality, residency or both. Having the right to vote does not entirely depend on being a national, as in some countries it (also) depends on residence: whether or not expatriates should have the right to vote, and whether or not non-national residents (immigrants) should be allowed to vote. In the age of globalisation and technological progress the potential impact of the expatriates’ votes has become considerable with elections being potentially decided “from abroad”. Globalisation increases mobility, which affects the size of the expatriate community and strengthens the transnational bonds. Technological innovation has, among others, the effect that voting from abroad has become much easier. With electronic voting, space ceases being a decisive factor for the possibility to vote. As will be shown in the next section, electoral rights for expatriates vary considerably across countries and have a strong (potential) impact on the size and shape of the electorate.

Electoral laws also vary concerning the resident population. Increasingly, countries differ in whether they grant voting rights to non-national residents. Although a trend towards electoral rights for non-national residents can so far mainly be observed at the local level, a few countries granted the right to vote in national elections to all residents.⁷ The effect the expansion of the electoral right to non-nationals has on the shape and size of the electorate depends on the size of the foreign community in a given country. The impact of the electoral rights to non-national residents on the variance in the electorates across countries depends on the migration flows and on naturalisation laws. All this increases the discrepancy between electorate and citizenship, as well as the extent to which this discrepancy varies across countries. According to our definition of citizenship it leads to *newly disenfranchised groups*, namely expatriates and immigrants. Examples of citizens who lost the right to vote back

⁷ We limit our discussion to the right to vote at the national level and exclude provisions for political rights for non-national residents at the local or regional level. We also exclude political rights in foreign countries due to supra-national democratic bodies such as the European Parliament.

“home” but did not acquire it in the receiving country are numerous (for example, Turks in Germany), with some cases of explicit discouragement from both the sending and the receiving country.⁸

We do not make the claim that inclusiveness *necessarily* affects the voter–representative relationship. The quality of representation is in principle independent from levels of inclusiveness.⁹ However, if the preferences of the emigrants and immigrants systematically differ from the national resident ones, whether these groups keep or receive the right to vote (through naturalisation or the electoral law) matters for the citizen–representative congruence. The claim this paper makes is that the analysis of the quality of representation can no longer afford to use the shortcut of equating citizenship with the electorate as increasingly large and permanent segments of the citizenship are excluded (rather than included) from access to political rights. It is this discrepancy between citizenship and electorate – a problem of inclusion rather than representation – that this paper is concerned with.

⁸ We deliberately renounce to discuss the exclusion of other social groups such as minors, prisoners and mentally ill persons for which provisions also widely vary across countries.

⁹ In theory, one can achieve perfect representation also when no citizen has the right vote.

III. A Typology of Electorates

III.1. *Four Types of Electorates*

In developed democracies the shape of the electorate can ideal-typically be summarised in four different types depending on whether or not the electoral right is given to non-national residents and/or expatriates. Similar to Bauböck (2005: 685), who distinguishes between four perspectives on “expansive electoral rights”, we distinguish four types of electorates:

- The *national-resident electorate* includes nationals living in their home country. It excludes non-national immigrants and nationals who expatriated. It is the most restrictive type of electorate as, according to this ideal-type, only nationals living within the borders of “their” state are entitled to vote. The closest empirical case of this type is Canada.¹⁰
- The *national electorate* includes all nationals independently of whether they are resident in their “homeland” or not. Voting rights are granted to nationals in the home countries and to nationals who emigrated abroad (expatriates). The principle here is purely based on membership. The closest empirical case of this type is Italy.¹¹
- The *resident electorate* includes all individuals who are resident in a given country independently of their nationality. Whether or not they are nationals, people living in a country have the right to vote. The principle here is purely territorial. This includes resident nationals and non-national immigrants. The closest empirical case of this type is New Zealand.¹²
- The *national and resident electorate* includes all nationals (whether or not they live in the home country) as well as all residents (nationals and foreigners). These are the most inclusive electoral rules extending political rights not only to expatriates but also to non-national residents. Both membership and territory principles apply. The closest example of this type is Britain but, strictly speaking, there are no empirical cases.¹³

¹⁰ For all these examples qualifications are in order. In Canada, for example, expatriates have the right to vote from abroad during the first five years after emigration.

¹¹ Italy only recently introduced provisions for voting from abroad linked to registration in a consulate. Before, expatriates had to travel back to Italy to make use of their right to vote.

¹² This is due to the very short period of time during which expatriates keep the right to vote from abroad (three years). The minimum requirement for qualifying to vote for residents is one year for non-nationals.

¹³ British nationals living abroad can vote as long as the first 15 years after expatriation. Furthermore, the category of “residents” is very expansive as it includes all resident Commonwealth nationals (as well as Irish nationals).

These types of electorates are listed from the most restrictive to the most extensive. The two principles that apply are the membership and the territorial one. Their combination can be depicted as in Figure 1. Two types are pure in the sense that they are based on either territorial or membership principles, whereas two are mixed in the sense that they combine both principles. Below we will show the degree to which developed democracies fit into these ideal-types and, consequently, the degree to which they differ. We do not rely only on the qualitative description of the rules, but also present quantitative data on the actual shape and size of the electorates. For the moment being, we concentrate on types and sources of variation between countries.

Figure 1: Four types of electorates in modern democracies

		"Territory" Electoral rights to non-national residents	
		Yes	No
"Membership" Electoral rights to national expatriates	Yes	National and resident electorate	National electorate
	No	Resident electorate	National-resident electorate

III.2. Sources of Cross-Country Variation

Electorates across countries vary because of differing provisions in two types of laws: first, the nationality law and, second, the electoral law. In addition, electorates vary because of differences in immigration and emigration rates.

1. *Nationality laws* are relevant for variations in electorates, and in the degree of discrepancy between citizenship and electorate, as *nationality automatically gives access to political rights*. Nationality laws affect *membership*. First, nationality laws determine the size of expatriate electorate (emigration) in that it rules on the maintenance of nationality after leaving the country (especially for further generations). Second, nationality (here, strictly speaking, naturalisation laws) determines the size of non-national resident communities

(immigrants) in that it rules on the access to nationality for resident immigrants (again also for further generations). Nationality laws affect the extent to which more or less large immigrant/emigrant groups get (or keep) nationality and consequently political rights.

2. *Electoral laws* are relevant for variation in electorates, and in the degree of discrepancy between citizenship and electorate, as *they grant the right to vote*. Electoral laws affect *territoriality*. First, electoral laws rule on the right to vote within the country for non-nationals. It is through the electoral law that political rights are given to residents who are not nationals (immigrants). Second, electoral laws rule on the right to vote outside the country for nationals. It is through the electoral law that political rights are given to nationals who are not resident (emigrants). Electoral laws affect the extent to which more or less large immigrant/emigrant groups get (or keep) political rights (independently of nationality).

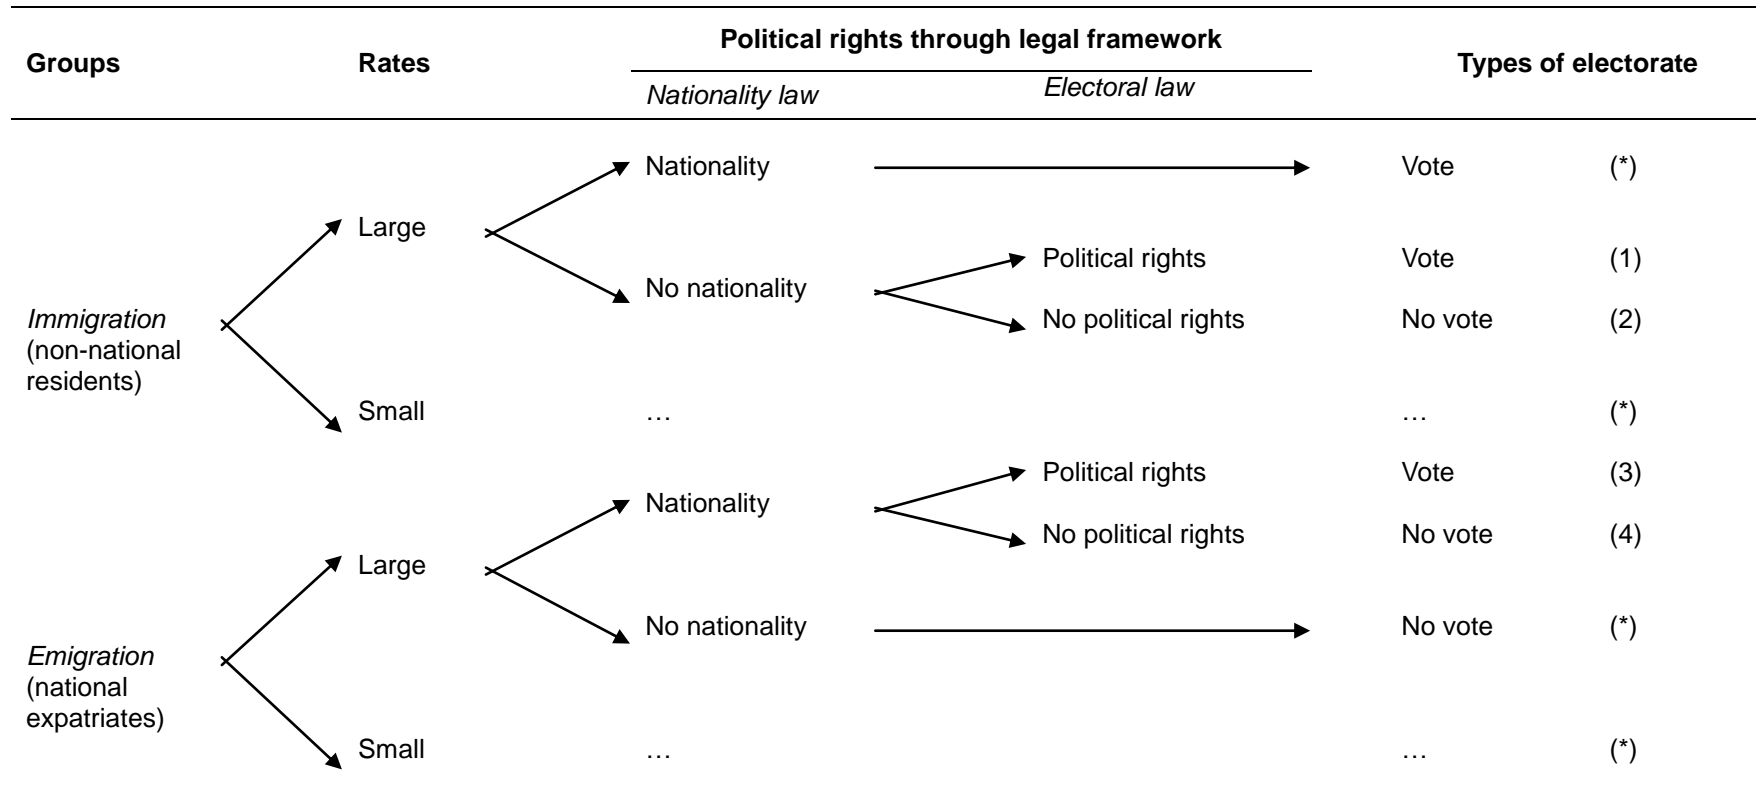

3. The *interaction between migration rates and the two types of law* is crucial, as the data in the quantitative part of the paper (next section) show. Figure 2 summarises the discussion. What appears to be crucial is the interaction between rates of immigration/emigration (and therefore the size of non-national resident groups and expatriates) on the one hand, and the legal framework which makes it possible to access the right to vote. As mentioned, there are two possibilities for getting the right to vote: nationality and electoral law.

The groups of non-national residents and expatriates can be either small or large (we simplify for the sake of the argument). We ignore the possibility in which they are small as this does not affect the level of discrepancy between citizenship and electorate. If there are only very little numbers of immigrants and emigrants, citizenship and electorate correspond. They also correspond if immigrants are given the nationality since citizens acquire automatically the right to vote. Also when emigrants lose the nationality (and therefore claims to social rights) the two correspond.¹⁴ The interesting cases in the perspective of this paper are those in which one finds *large numbers of either immigrants or emigrants or both*. In this case we do not have a citizenship corresponding to the electorate as many nationals may not have the right to vote (because they live abroad) and many non-nationals living in the country may not have the right to vote. If there are large numbers of emigrants and/or immigrants, citizenship and electorate do not correspond *unless* the legal framework corrects for it (either through the nationality law or the electoral law).¹⁵ The last column of the table shows how the combination of legal provisions for the right to vote of emigrants and immigrants combine to determine the four types of electorates.

¹⁴ Note that losing the nationality does not only depend on the country of origin but also on the host country which may require emigrants to give up their nationality of origin.

¹⁵ The figure simplifies a much more complicated story in which access to political rights for nationals living abroad is made difficult by registration requirements. This is discussed and illustrated below in the quantitative part of the analysis.

Figure 2: Access to political rights for non-national residents (immigrants) and national expatriates (emigrants)

Legend: Combination 1–4: Resident electorate (New Zealand); Combination 1–3: National and resident electorate (Britain); Combination 2–3: National electorate (Italy, Portugal); Combination 2–4: National-resident electorate (Canada); (*) Cases in which citizenship and electorate correspond.

IV. Discrepant Electorates in 22 OECD Countries

We divide the empirical analysis in two parts. First, qualitatively, we carry out the analysis of nationality laws and electoral laws, and how they empirically vary across countries. Second, quantitatively, we propose an analysis of the discrepancy between citizenship and electorate based on the size of expatriate and non-national resident groups.

IV.1. *Qualitative Analysis: Naturalisation Laws and Electoral Laws*

As we have seen above, it is possible to acquire voting rights either through *nationality* laws or through *electoral* laws. The first includes individuals in the membership of nationals, or excludes them. The second includes individuals resident in a territory (non-national citizens) and those resident abroad, or excludes them. What appears from the comparative information collected for 22 OECD countries presented in Table 1 is that *countries vary above all in regard to nationality laws and hardly vary in regard to electoral laws*.

On the one hand, in only very few countries do electoral laws allow non-national residents (immigrants) to vote in national or federal elections. The only such case is New Zealand. There are other two cases in which specific types of “non-nationals” are allowed to vote: first, Brazilians in Portugal under a number of special conditions; second, British nationals in Ireland; third, Commonwealth and Irish nationals in the United Kingdom. In no other country in the sample considered here can resident foreigners participate in national or federal elections. On the other hand, almost all countries allow their national expatriates (emigrants) to maintain the right to vote. As we see from Table 1 most countries allow their nationals abroad to keep the right to vote either indeterminately or for a more or less long period of time. In this regard, the variation is quite large. Out of the 22 countries, 15 allow expatriates to maintain the right to vote without time limits. There is one country that does not allow its nationals to vote if living abroad: Ireland.¹⁶ Considering the size of Irish emigration to the United States, granting emigrants the right to vote would mean that the election could be decided overseas. Among the remaining six countries, there are three that allow to keep the right to vote for a short period of time (New Zealand for three years, Canada for five and Australia for six). Portugal allows emigrants to vote in national elections for up to ten years after expatriation. The impact of this variation on the discrepancy between citizenship and electorate obviously depends on the size of both immigration and emigration. We will deal with the interaction between laws and rates of migrations in the quantitative analysis.

¹⁶ The exception being diplomats and military.

Table 1: Electoral rights at the national level for non-national residents (immigrants) and national expatriates (emigrants) in 22 OECD countries

Country	Electoral rights for national expatriates (emigrants) ¹	Electoral rights for non-national residents (immigrants)	Access to nationality (MIPEX Index, 0–100)	Share of foreign-born residents (2000/01)
Australia	For the first six years	No	N.a.	23.1
Austria	Yes	No	22	10.5
Belgium	Yes	No	71	10.3
Canada	For the first five years	No	67	18.1
Czech Republic	Yes	No	50	4.2
Denmark	Yes	No	33	5.8
Finland	Yes	No	44	2.6
Germany	For the first 25 years	No	38	12.5
Iceland	Yes	No	N.a.	N.a.
Ireland	No ²	Partly ⁴	62	8.7
Italy	Yes	No	33	2.5
Japan	Yes	No	N.a.	N.a.
Luxembourg	Yes	No	45	33.2
Netherlands	Yes	No	51	10.1
New Zealand	For the first three years	Yes	N.a.	17.2
Norway	Yes	No	39	6.8
Portugal	For the first ten years ³	Partly ⁴	69	5.1
Spain	Yes	No	41	5.3
Sweden	Yes	No	71	11.5
Switzerland	Yes	No	44	21.9
United Kingdom	For the first 15 years	Partly ⁴	62	7.9
United States	Yes	No	N.a.	11.0

Notes:

- 1) In most countries, expatriates usually need to register as voters (Green, 2007).
 - 2) Only diplomats and military.
 - 3) Not more than 15 years in the EU or a Portuguese speaking country. Additionally, they have to stay at least 30 days in Portugal in the last five years, and speak Portuguese (Costa Lobo, 2007: 84).
 - 4) In the case of Ireland British residents are also allowed to vote for Dáil elections. In Portugal, Brazilian citizens with special rights acquire voting rights, and in the United Kingdom, these rights include Commonwealth and Irish citizens.
- N.a. Information not available.

Sources: Data on expatriate voting rights from IDEA (2007); electoral rights for immigrants and access to nationality from Migrant Integration Policy Index (2007); data on foreign born population from OECD (2006).

Contrary to electoral laws, nationality laws vary a great deal across countries in the extent to which they give access to nationality and, consequently, voting rights. Nationality laws are the set of rules through which the conditions for the gain or loss of nationality are set. For clarity we will speak in general of “nationality law” to indicate the extent to which emigrants maintain their nationality of origin, and of “naturalisation law” to indicate the extent to which immigrants acquire the new nationality. Most countries do not deprive emigrants of their nationality even after generations – some do for the third generation. Nationality laws therefore do not vary a great deal in regard to national expatriates (emigrants).¹⁷ They do vary, however, a great deal in regard to the naturalisation of non-national resident citizens. While naturalisation laws based on *jus sanguinis* are very closed towards ethnically distinct immigrants – and therefore generate large numbers of non-national residents – countries based on *jus soli* tend to be much more open in the way they naturalise the majority of their immigrant residents. Good examples of “hard-to-get” naturalisation are Austria and Switzerland. The third column in Table 1, however, points to other countries for which naturalisation for non-national residents is difficult. Using the MIPEX index that operationalise the easiness with which single nationalities can be acquired, we see that besides Austria and Switzerland, also Germany, Denmark and Finland (as well as Italy and Spain) have naturalisation laws unfavourable to the incorporation of non-nationals in the electorate through the nationality law.

The discussion so far leads us to conclude that electoral laws vary little with the exception of Ireland (as far as the electoral law on emigrants is concerned) and New Zealand (as far as the electoral law concerning immigrants is concerned). In regard to the acquisition of nationality and therefore the automatic access to political rights, again we find little variation concerning nationality law (emigrants). However, there is a large variation in naturalisation laws (immigrants). This information leads us to formulate the hypothesis that differences in the levels of discrepancy (between citizenship and electorates) are primarily caused by variations in naturalisation laws, and amplified by a large influx of immigrants.

IV.2. Quantitative Analysis: Size of Emigration and Immigration

In this section we proceed in three steps. First, we describe citizenship in 21 countries.¹⁸ Then, we describe electorates. Finally, we describe the discrepancy between citizenship and electorate and interpret variations in the levels of discrepancy with reference to (1) nationality and electoral laws (mentioned above) and (2) rates of immigration and emigration.

¹⁷ Regulations regarding the maintenance of nationality for expatriates is made more complicated by conditions set by the receiving country and the possibility to have a double nationality. A good example is the impact on the German naturalisation law on the propensity of Turkish immigrants to resign from their former nationality before the change of the German naturalization law in 2002.

¹⁸ We must unfortunately exclude New Zealand from this part of the analysis because of unreliable information.

The data on which we can draw are official register data from national statistical offices and from the OECD. Census data contain the number of residents and the number of non-national residents by age cohorts. The size of the electorates has been derived from data on electoral results. The data on expatriate communities had, in several cases, to be estimated. The most valid (and in many cases only) estimates on the size of the expatriate community have been calculated by the OECD for the year 2000 (2001 for Italy). They only include the number of expatriates in other OECD countries and should therefore be interpreted as the lower bound of the real number. The data further estimate the number of expatriates at the age of 15 or older and do therefore slightly overestimate the share of expatriates at voting age.

Table 2: Citizenship in 21 OECD countries

Country	Adult citizenship (absolute)	Non-national residents (immigrants)	National expatriates (emigrants) (as % of citizens)	Resident nationals	Total
Japan	104,353,921	1.1	0.6	98.4	100.0
Czech Republic	8,413,143	1.8	2.7	95.6	100.0

Iceland	223,839	3.3	10.3	86.4	100.0
Portugal	9,531,004	2.6	13.3	84.1	100.0
Switzerland	5,969,867	18.2	4.4	77.4	100.0
Austria	7,548,342	18.0	4.8	77.2	100.0
Ireland	3,516,392	6.0	22.5	71.4	100.0
Luxembourg	363,846	33.3	7.5	59.3	100.0

Notes: Countries are ordered by size of resident nationals. Citizenship is defined as the sum of all nationals (in country and abroad) and all residents in the country (whether nationals or not). All figures exclude youngsters below 18 years of age. The interpretation of such figures must allow for bias caused by prisoners and mentally ill persons who, in some countries, are excluded from voting rights. New Zealand is excluded because of unreliable information.

Sources: National statistical offices; Dumont and Lemaître (2005). Because in the case of the Czech Republic and Spain the estimates have been unrealistically low, the share of expatriates is estimated as the deviation of the electorate from the national residents.

Table 2 presents some basic information about citizenship, defined as access to social rights, for our sample of 21 countries. Let us remind that we consider citizens all those who possess the nationality of the country (whether they live in the country or not) plus those who live in the country (whether they are nationals or not). It is interesting to see that there is a great deal of variation in the composition of citizenship in these countries. There are six countries which have a proportion of non-national residents (immigrants) between 5% and 10% (United Kingdom, Belgium, Germany, United States, Ireland and Sweden). There are two countries with much higher proportions: Austria and Switzerland (about 18%). And, finally, Luxembourg with 33% of non-national resident citizens (mostly due to European institutions and financial centres). For the remaining 12 countries, the proportion of non-national residents is below 5%. Some variation exists also in the proportion of citizens who live abroad, that is national expatriates (emigrants). The large exception here is Ireland with 22.5% of its citizens living overseas. Iceland and Portugal have a share of expatriates around 10–13%. Three countries have rates of nationals living abroad of 5–8% (Finland, Italy, Luxembourg and the United Kingdom). The remaining 14 countries have rates of expatriates of less than 5%.

Table 3: Electorates in 21 OECD countries

Country	Citizenship	Electorate	Difference	Difference (as % of total citizenship)
Luxembourg	363,846	221,103	142,743	39.2
Switzerland	5,969,867	4,628,782	1,341,085	22.5
Austria	7,548,342	5,912,592	1,635,750	21.7
Canada	25,326,533	21,243,473	4,083,060	16.1
Ireland	3,516,392	3,002,173	514,219	14.6
Australia	14,882,361	12,708,837	2,173,524	14.6
Germany	69,992,647	61,432,868	8,559,779	12.2
Belgium	8,477,923	7,570,637	907,286	10.7
United Kingdom	48,720,576	44,403,238	4,317,338	8.9
Denmark	4,361,200	3,998,957	362,243	8.3
Netherlands	13,071,282	12,035,935	1,035,347	7.9
United States	210,088,689	194,327,000	15,761,689	7.5
Portugal	9,531,004	8,902,713	628,291	6.6
Sweden	7,151,617	6,722,163	429,454	6.0
Norway	3,564,658	3,358,856	205,802	5.8
Iceland	223,839	211,289	12,550	5.6
Japan	104,353,921	100,433,798	3,920,123	3.8
Spain	34,355,265	33,045,318	1,309,947	3.8
Italy	50,810,452	49,358,947	1,451,505	2.9
Finland	4,335,367	4,220,951	114,416	2.6
Czech Republic	8,413,143	8,264,484	148,659	1.8

Notes: Countries are ordered by level of discrepancy as a percentage of citizenship. New Zealand is excluded because of missing information.

Sources: National statistical offices; Dumont and Lemaitre (2005).

In Table 3 countries are ranked according to the degree of discrepancy between citizenship and electorates (last column). The simple indicator we use here is the percentage of citizens without voting rights, that is, those not included in the electorate. It is a measure of “political exclusion”: the larger the percentage, the more exclusive the franchise. On top of the table, Luxembourg stands out with nearly 40% of citizens – i.e. mostly non-national residents (immigrants) – excluded from voting rights. Table 4 below informs us about the *composition* of this excluded segments of the citizenship. Around 85% of the disenfranchised citizens in Luxembourg are immigrants and only 15% are nationals who expatriated. Two very similar cases are Austria and Switzerland. For the two Alpine cases, too, there is a large proportion of citizens who does not have the right to vote in federal elections (about 22% in both cases). This is one out of five citizens. As for Luxembourg, disenfranchised citizens are mostly (above 80% for both Austria and Switzerland) non-national residents.¹⁹ Additional similar cases are Belgium, Germany, Sweden, Norway, Finland and Italy. For these countries we see a lower level of discrepancy, that is, exclusion. However, the composition of the excluded citizens is very similar to that of Luxembourg, Switzerland and Austria, with more than 65% of the excluded citizens being immigrants.²⁰

Things look differently for Portugal and Ireland, as well as for Denmark, the Netherlands and Japan. Portugal does not have a very high rate of discrepancy (6.6%). It is only slightly higher for Denmark and the Netherlands (about 8%) while for Japan it is 3.8%. On the contrary, the rate is quite high for Ireland (14.6%). What these five cases have in common is that the proportion of citizens without voting rights are to a large extent national expatriates who lost the right to vote. The proportion of expatriates among the disenfranchised citizens is around 75% for Ireland, 60% for Portugal, and around 50% for Denmark and the Netherlands. Another country for which the proportion is high is Japan: above 70% of the discrepancy (which, however, is a small one) is due to national expatriates. This is explained by the very low immigration rates in Japan.²¹

¹⁹ The same is true for Spain and the Czech Republic. Because in these cases the OECD estimates of the expatriate community have been unrealistically low, it has been estimated as the deviation of the electorate from the national residents. In reality, however, the share of expatriates without the right to vote is still somewhat higher implying that slightly less than 100% of the disenfranchised are immigrants.

²⁰ Incomplete data sources do not allow us to comment on Australia, Canada and New Zealand.

²¹ Other countries with a quite large segment of expatriates among the excluded citizens are Iceland, Italy, Finland and the United Kingdom. The proportion of emigrants in the segment of citizenship without voting rights is above 30% for all these countries.

Table 4: Composition of discrepant electorates in 18 OECD countries

Country	Difference citizenship–electorate	Difference (as % of citizenship)	Non-national residents (immigrants)	Non-national residents (as % of difference)	National expatriates (emigrants)	Expatriates without vote	Expatriates without vote (as % of difference)
Luxembourg	142,743	39.2	121,058	84.8	27,164	21,685	15.2
Switzerland	1,341,085	22.5	1,084,645	80.9	262,456	256,440	19.1
Austria	1,635,750	21.7	1,357,388	83.0	366,024	278,362	17.0
Ireland	514,219	14.6	211,742	41.2	792,316	385,000	74.9
Germany	8,559,779	12.2	5,774,762	67.5	2,933,757	2,785,017	32.5
Belgium	907,286	10.7	727,161	80.1	321,544	180,125	19.9
Denmark	362,243	8.3	191,261	52.8	173,009	170,982	47.2
Netherlands	1,035,347	7.9	515,156	49.8	616,909	520,191	50.2
Portugal	628,291	6.6	244,526	38.9	1,268,726	383,765	61.1
Sweden	429,454	6.0	386,977	90.1	206,604	42,477	9.9
Norway	205,802	5.8	147,125	71.5	122,079	58,677	28.5
Iceland	12,550	5.6	7,450	59.4	23,070	5,100	40.6
United Kingdom	4,317,338	8.9	2,710,900	62.8	3,229,676	1,606,438	37.2
Japan	3,920,123	3.8	1,121,446	28.6	575,992	2,798,677	71.4
Spain	1,309,947	3.8	1,309,947	100.0	849,298	0	0.0
Italy	1,451,505	2.9	1,003,451	69.1	3,649,377	448,054	30.9
Finland	114,416	2.6	76,425	66.8	265,245	37,991	33.2
Czech Republic	148,659	1.8	148,659	100.0	241,529	0	0.0

Note: This table does not include the United States, Australia and Canada for which data on the composition of the discrepancy between citizenship and electorate is strongly influenced by registration rules which make the interpretation of data difficult. Data on the number of registered voters are not available. Furthermore, for the US special regulations in regard to prisoners further bias the figures. New Zealand is excluded because of unreliable data. For Spanish and Czech figures, see footnote 19.

These figures are summarised graphically in Figure 3. The level “zero” indicates the number of voters as of official electoral registers. The four bars indicate *deviations from the electorate*. The white bars correspond to our definition of citizenship: all nationals (wherever they live) plus all those living in the country and paying taxes there (whatever their nationality). In some countries, such as Luxembourg, Switzerland and Austria, there are many more citizens than voters. The striped bars show that in most cases there are more nationals than voters and, therefore, that there always are nationals without the right to vote (those living abroad). The dotted bars indicate that the number of nationals living in the country is usually only a part of the electorate, although a very large one obviously. Negative bars indicate here that the group of national residents is smaller than the electorate. This means that in these countries expatriates have the right to vote, with the exception of Ireland where the discrepancy between the share of national residents and the electorate is due to the voting rights of British nationals. The gray bars, finally, indicate that there are countries such as Luxembourg, Austria and Switzerland (but also Germany) where the discrepancy between citizens and voters is caused by the exclusion of immigrants who do not have voting rights through the electoral law and who have a difficult access to nationality (and through that to voting rights).

Figure 3: Citizenship and electorate in 18 OECD countries

In these cases we see very clearly the interaction at play between immigration flows and nationality (or naturalisation) laws. The largest discrepancies between citizenship and electorate exist in those cases in which *large rates of immigration are combined with restrictive nationality laws*. As seen above, this is the factor that really *varies across countries*. Whereas electoral laws hardly ever allow non-national residents to vote, naturalisation may or may not give access to voting rights. It is therefore the *interaction between high rates of immigration and restrictive naturalisation laws* that explain most of the cross-country variation of discrepancy between electorate and citizenship. The same cannot be said to the same extent for national expatriates. Here rates count, too, but as we have seen the variation in electoral laws (granting voting rights to emigrants) is small.

V. Conclusion

This paper has shown that the quality of representation does not only depend on the degree to which voters' preferences are congruent with those of the representatives, but also on the degree to which citizens are included in the representation circuit. Based on a broad definition of citizenship we have shown that citizen–representative congruence cannot be equated with, and operationalised through, voter–representative congruence. The more or less large discrepancy between citizenship and electorate makes this one-to-one equivalence between citizenship and electorate problematic. The paper therefore questions the “denominator”, whether using electorates can replace citizenship. Our goal was to shift the discussion back to more fundamental problems of inclusion/exclusion, to which globalisation and the increasing geographical mobility of individuals gives new scope.

Empirical results of the paper show that the main source of discrepancy between citizenship and electorate is the combination of high rates of non-national residents (immigrants) in countries in which naturalisation laws make it difficult to access nationality and thus voting rights. This large discrepancy is also not solved by electoral laws since these do usually not grant voting rights to non-nationals. Problems of representation are therefore strictly linked to conceptions of nationality – who is a member of the *national community* and who is not – and to conceptions of citizenship – who is a member of the *political community* and who is not. In principle, it would be possible to imagine changes in electoral laws granting voting rights to citizens *without making them nationals*. This would make it possible to include citizens in the political community without including them in the national community. It is an instrument that would solve normative conflicts about confusing definitions of who is a national and who is not. It would also solve problems of temporality, since electoral laws could make voting rights for non-nationals dependent upon residency. Non-national citizens vote as long as they live and pay taxes in a country, and lose the right as soon as they leave it. This paper, thus also points to normative implications for future research and policy making.
