

COMMISSION OF THE EUROPEAN COMMUNITIES

COM(94) 28 final
Brussels, 21.03.1994

REPORT FROM THE COMMISSION TO THE COUNCIL

ON THE DEVELOPMENT OF VINEYARDS IN THE EUROPEAN COMMUNITY
AND THE RELATIONSHIP BETWEEN PRODUCTION AND CONSUMPTION IN THE WINE SECTOR

1991-1992

INTRODUCTION

1. This report on changes in winegrowing potential and the relationship between production potential and consumption of wine sector products has been drafted pursuant to Article 9 of Regulation (EEC) No 822/87 on the common organization of the market in wine (COM)⁽¹⁾.

The report was drafted using:

- data from the statistical surveys of agricultural areas⁽²⁾, principally the intermediate surveys carried out annually and the basic surveys carried out every ten years, the availability of two basic surveys (1980 and 1990) permitting a more detailed analysis of the sector's development;
- data submitted to the Directorate-General for Agriculture at the Commission (DG VI) by the Member States, principally for the purposes of the annual wine balance (production-consumption) used for the management of Community intervention measures in the wine sector;
- in certain cases, data taken from the vineyard register⁽³⁾ or the trade press.

Production potential is usually taken to mean the area under vine and the average production expected from that area given an average yield. Note

(1) OJ No L 84, 27.3.1987, p. 1.

(2) OJ No L 54, 5.3.1979 [Regulation (EEC) No 357/79].

(3) OJ No L 208, 31.7.1986 [Regulation (EEC) No 2392/86]

should be taken of the considerable variation in wine production from year to year as a result of the sensibility of grapes to changes in the weather during the growing season (spring frosts in the north, summer drought in the south etc.) or at harvest time (rain) and rapidly developing diseases which can ruin the harvest. This makes the prediction of grape harvests more difficult than that of field crops and estimates of medium-term production trends less reliable.

Community winegrowing potential is regulated through rules on planting involving a system of planting rights which enable the development of areas under vine to be controlled. To be able to plant, a winegrower requires authorization from the authorities granted in the form either of a replanting right following the grubbing-up of an existing vineyard (to enable the normal renewal of vineyards) or a new planting right, currently only granted in certain restricted cases (experimentation, repara-celling etc.). As a general rule replanting is prohibited because of the structural imbalance between supply and demand in the wine sector. As a result of the controls on planting and the permanent abandonment premiums in respect of winegrowing areas⁽⁴⁾ (a grubbing-up premium is granted to applicants in return for grubbing up specified areas and the loss of replanting rights) the area under vine in the Community is falling. Around 50 000 hectares per annum were grubbed up in return for a premium during the 1988/89 to 1990/91 wine years.

(4) OJ No L 132, 28.5.1988, Regulation (EEC) No 1442/88.

2. Attention is drawn to the nature of the data contained in this report and their fields of application as defined in the common organization of the market in wine. A distinction should be made, for example, between the area in production and the area under vine which includes young, non-productive vines, or the potential area under vine. The latter includes valid but unused plantation rights. Equally, data on wine production only takes account of areas planted with wine grapes, whilst that on total areas also includes areas planted with other varieties (table grapes, grapes for drying etc.). This is particularly relevant in the south of Italy and Greece where large quantities of grapes are grown for other uses.

Data on areas under vine can be broken down according to various criteria using the 'Vitis' database developed by the Statistical Office of the European Communities (SOEC), for example, by administrative region. DG IV, however, only has data on annual production (the wine balances) broken down by Member State rather than by region. It is therefore difficult in this report to show the development of production potential region by region. Given the wide differences in yield and products between regions, a comparison between changes in production potential between regions cannot be made simply on the basis of area data. Furthermore, to correctly assess changes in areas within a region, account must also be taken of the ageing of the stock of vines or conversely of the measures taken to renew it (average age of vines, training system, varieties of vines, changes in the agronomic yield, average size of vineyards, number of young farmers etc.) and of Community subsidies from the Structural Funds for restructuring vineyards. The gathering of such analytical data is, however, well beyond the scope of this report.

3. The data supplied reveals a significant fall in areas under vine over the last ten years but a less-than-proportionate fall in production due to a general increase in average yields. Furthermore, the reduction in area in the south of the Community disguises an increase in the northern regions which, given higher average yields, has had a greater impact on production. Owing to the continuous fall in consumption levels, there has been a constant imbalance between production and use. The fact that vines are perennial crops (grown for between 20 and 60 years) requiring special investment repayable over a long period is a source of inertia. At the same time, the market is tending to react ever more quickly.

The relative margin of error in the data prevents the rate of development being determined with sufficient accuracy to allow a correct assessment of the impact of Community policies intended to manage production potential (grubbing-up premiums, control of replanting rights and yields etc.). Figures may vary by more than 10% from one set of data to the next depending on the source, while the annual grubbing-up rates are of the order of 2% to 4%. There is a clear discrepancy between the statistics supplied by Spain, which are subject to subsequent correction by the SOEC, and those published by Eurostat. In addition, successive accessions (Greece, Spain and Portugal) prevent the changes occurring over the period in question being calculated for the Community as a whole. The Member States do not submit estimates of changes in production potential (see Table 2.2), which makes this all the more difficult to do at Community level.

4. There has been a relative increase in the production of quality wines (quality wines psr) linked to a significant move towards higher-quality vine varieties. Similarly, the reason for the fall in the area under varieties intended for the production of table wines can be found in the policy of granting premiums for grubbing up. There has also been a reduction in the growing of traditional local varieties to the detriment of better-known varieties such as chardonnay, riesling and cabernet sauvignon and a cautious introduction of new varieties in the north of the Community.

As regards structural changes, it must be stressed that the sector is made up of a large number of very small vineyards, two-thirds of which are of less than one hectare. Such vineyards, however, account for less than 20% of the total area under vine and still less of production sold through the major marketing channels.

The reduction in the number of vineyards is to be seen principally amongst these small vineyards. The size at which the number of vineyards remains stable or is increasing varies from country to country with an average minimum of five hectares. It varies according to the age of the farmer, the degree to which the farmer specializes in winegrowing and the percentage of double active farmers, the type of production and the value placed on it. These parameters vary greatly from one region to another.

5. The recent adoption by the Council of a Regulation providing for the inclusion of data from the vineyard register in statistical surveys⁽¹⁾ will permit a considerable improvement to be made in the quality of data on vineyards and the analysis of and the estimation of trends in production potential enabling reliable predictions to be made for each region and type of product.

(1) OJ No L 289, 24.11.1993 [Council Regulation (EEC) No 3205/93 of 16 November 1993 amending Regulation (EEC) No 357/79 on statistical surveys of areas under vines].

VINEYARD REPORT

CONTENTS

INTRODUCTION

- 1 Characteristics and sources of data on vineyard areas
- 2 Presentation of data provided by Member States

AREAS

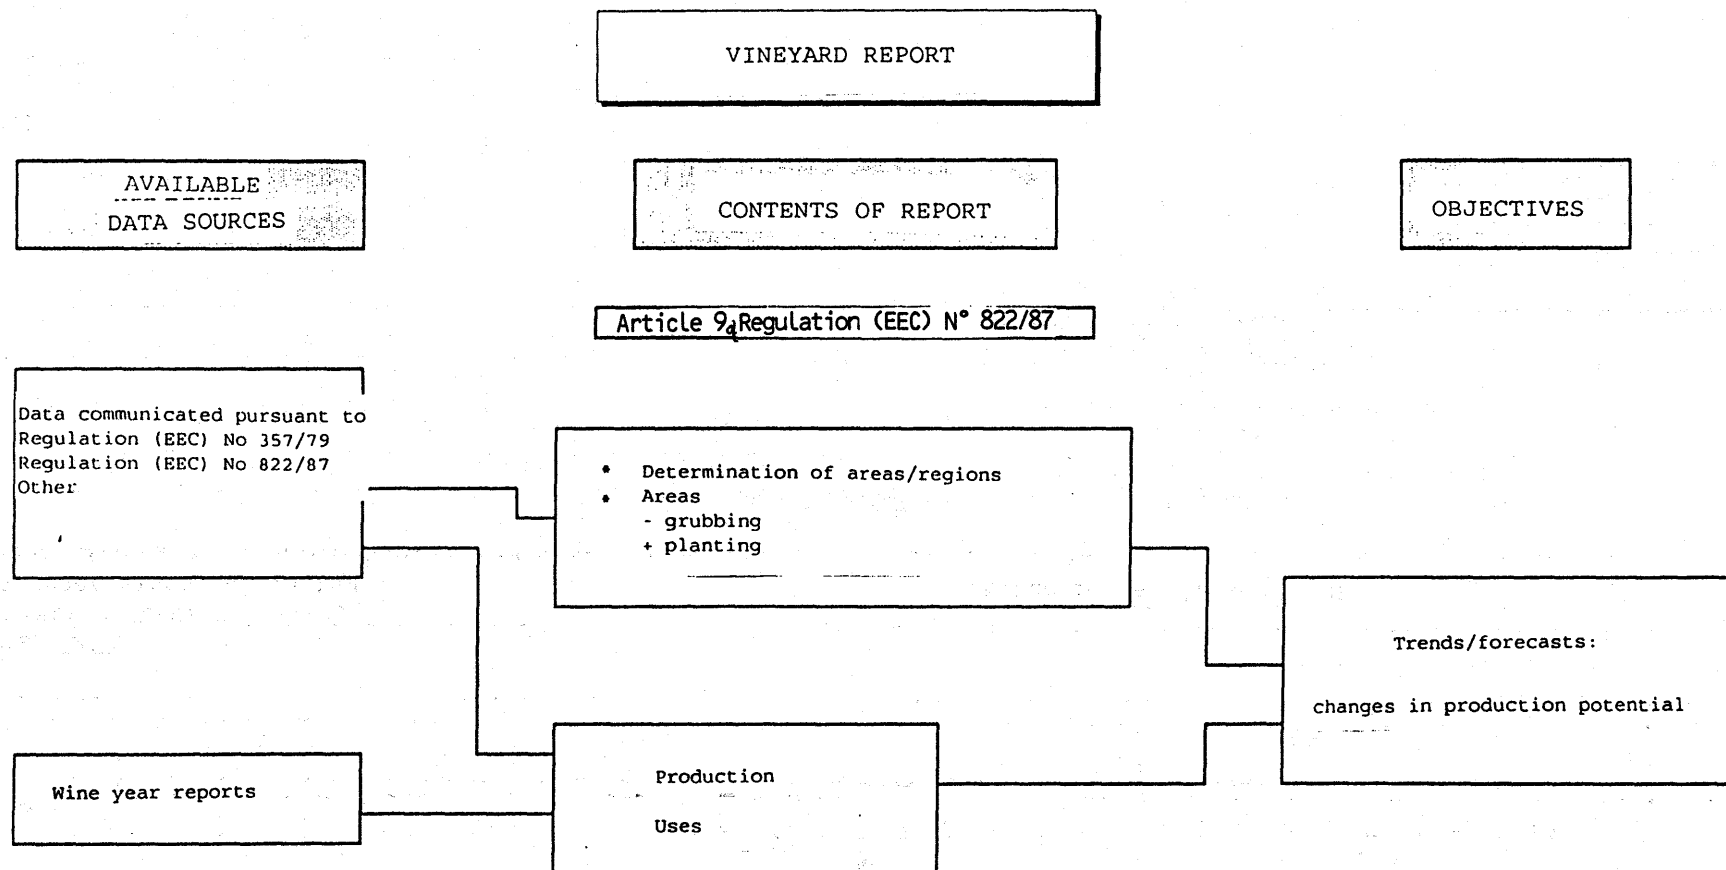

- 3 Trend of vineyard areas in Member States by use
- 4 Trend of vineyard areas in Member States by grape variety
- 5 Trend of vineyard areas in Member States as a function of annual movements (grubbing, planting)
- 6 Trend of vineyard areas in Member States by region
- 7 Trend of vineyard areas in Community regions as a function of annual movements (grubbing, planting)

PRODUCTION

- 8 Production
Data from final statements for 1980/81 to 1991/92
- 9 Production
Data from final statements
Breakdown according to use
- 10 Trend of production in Member States according to various sources
- 11 Trend of production in Member States
Calculation of yields (based on data from annual surveys and final statements)
- 12 Use levels by Member State and wine year
- 13 EUROSTAT-CRONOS data on production, areas and yields

Characteristics and sources of data on areas under vines

Situation at 31 August N

- according to type of production and yield class

- grubbed or abandoned
- replanted

Changes during wine year N-1/N

- production of grape must or wine

N harvest (wine year N/N+1)

Provisional supply balance

N harvest <> Management of market; intervention measures

↓

Definitive supply balance

Data transmission to
EUROSTAT: 1 May of year N+1

Communication of data to
DG VI: N+2

Remarks

- In the tables the data presented by calendar year correspond to the situation at the area under vines at 31 August of year N, i.e. to grubbing and planting operations carried out during wine year N-1/N, but indicate the area supplying production in the following wine year, N/N+1.
- The lack of uniformity of data sent by Member States and non-compliance with transmission deadlines delay data processing within Community institutions; whence their late availability.
- Availability is faster at Member State level; in France, for instance, the 1988 agricultural census results (SCEES-INSEE) were published in AGRESTE, Etudes N° 4, in June 1990.

BASIC SURVEYS
Regulation (EEC) No 357/79
PRESENTATION OF DATA

BASIC SURVEY (Article 2):

Basic surveys are carried out every 10 years and cover all holdings having an area under vines cultivated normally intended for the production FOR SALE of grapes, grape must, wine or propagating material. (NB: Family consumption should be estimated.)

CONTENTS OF BASIC SURVEY:

- utilized agricultural area
- area under vines cultivated
 - area under wine grape varieties:
 - for quality wines psr
 - for other wines
 - wine compulsorily intended for the manufacture of certain potable spirits obtained from wine with a registered designation of origin
 - area under wine grape varieties:
 - area planted with root-stock for future grafting
 - area cultivated solely for the production of vine propagating material subdivided into:
 - nurseries
 - parent vines for root-stock
 - area under grapes for drying

Vine varieties:

For each geographical unit a record should be made of the vine varieties which together constitute at least 70% of the total area under wine grapes and, in any case, of the varieties occupying not less than 3% of the said area.

Age of the vines:

The age of the vines should be calculated from the wine year in which they were planted or grafted in situ.

TABLE 1.4

INTERMEDIATE SURVEYS
Regulation (EEC) No 357/79
PRESENTATION OF DATA

INTERMEDIATE SURVEY (Article 5):

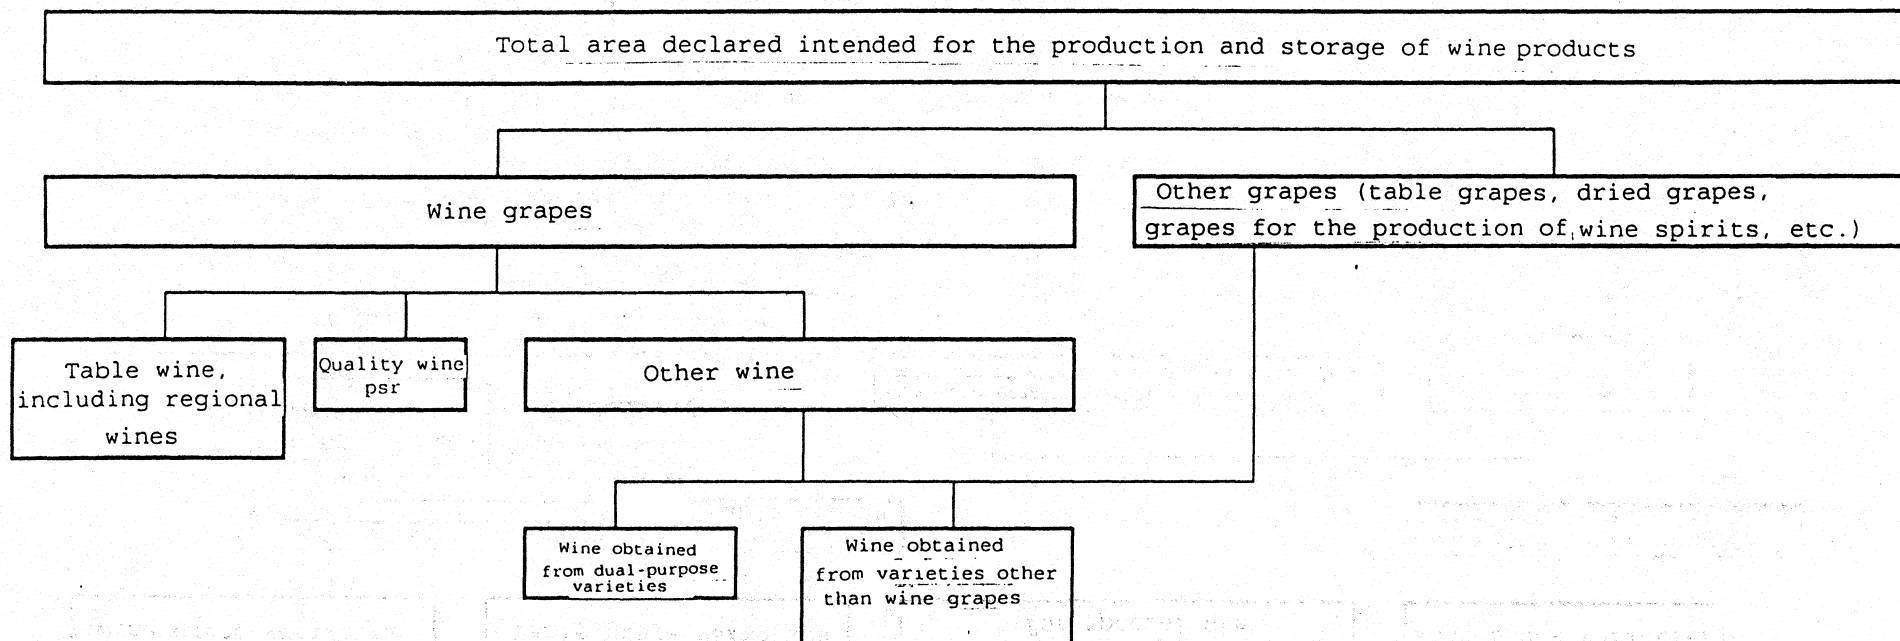

The intermediate surveys relate to the changes occurring in vineyard areas under wine-grape vine varieties during the preceding wine year.
(Note: The first intermediate surveys following the basic surveys relate to changes during the previous two wine years.)

CONTENT OF THE INTERMEDIATE SURVEYS:

- areas under vines normally used for the production of:
 - quality wines psr
 - other wines
 - wine compulsorily intended for the manufacture of certain potable spirits obtained from wine with a registered designation of origin
 - taking into account:
 - grubbing (including areas permanently abandoned after receipt of a grubbing premium)
 - replanting under the terms of a replanting right (Article 7 and Annex V, Regulation (EEC) No 822/87)
 - new planting under the terms of a new planting right (Article 6 and Annex V, Regulation (EEC) No 822/87)
- Breakdown by variety and at least by yield class as referred to in Article 6(2)
Results to be notified to the Commission before 1 May of the year following the wine year concerned (paragraph 5)
- Mean yields per hectare in hectolitres of grape must or wine from areas under wine grape varieties, broken down by yield class (Article 6)
 - Five-year forward estimate of average yields per hectare for each yield class (para. 3) (N.B.: This forecast is not generally communicated.)

TABLE 1.5

Classification of areas on the basis of harvest and production declarations (Regulation (EEC) No 3929/87)

- N.B.: - Harvesters whose holdings comprise less than 10 ares of vines and whose crop is not marketed are not required to make this declaration (Article 1)
- Harvesters whose entire crop is intended for consumption as such (table grapes) or for drying (dried grapes) or for processing directly into grape juice are not required to make this declaration (Article 1)
- Producers who obtain by vinification less than 10 hectolitres of wine which is not intended for marketing are not required to make this declaration (Article 2)
- Special circulation and distillation rules are defined for "other wines" (for the production of wine spirits, for example)
- Harvest declarations used for the purpose of managing wine and wine products (Regulations (EEC) No 822/87 and (EEC) No 823/87) are also used for statistical purposes (Article 10)

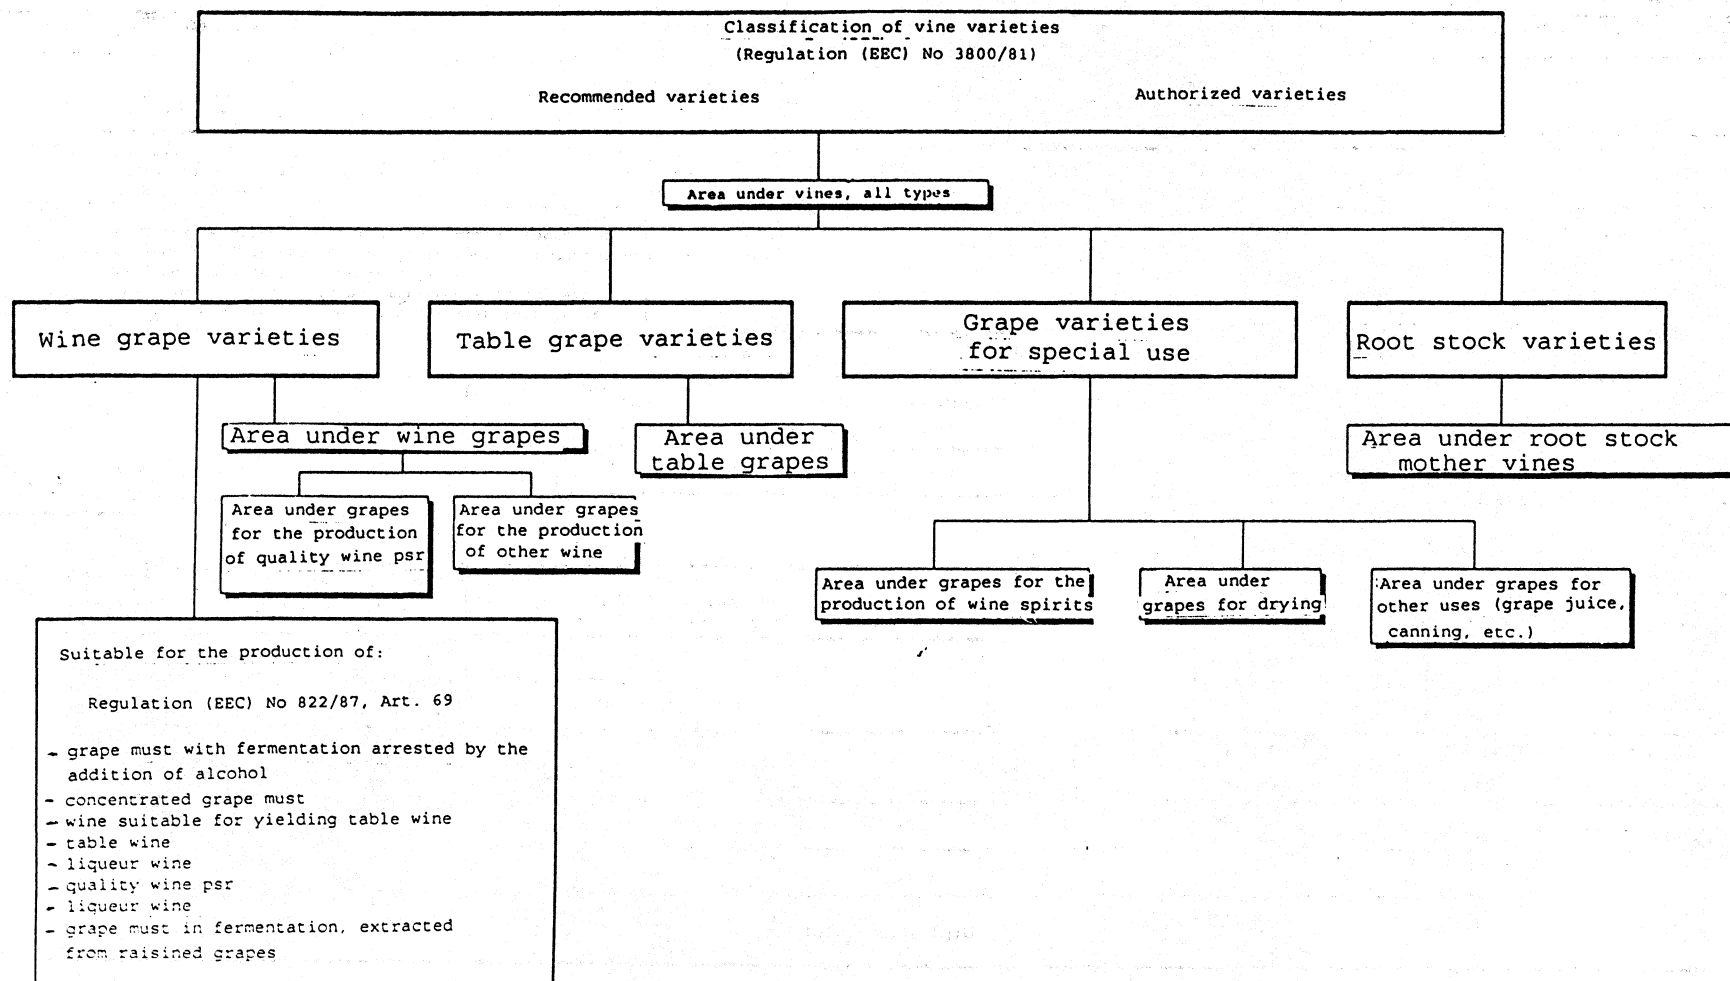

Remarks:

- The use of the areas has not been strictly defined in view of variations due to:
- objections/downgrading for quality wine psr
 - dual-purpose classification (varieties classified simultaneously as wine-grape varieties and as varieties intended for other uses)
 - the distillation of table grapes
- No areas under vines are defined for the production of concentrated must, grape juice or vinegar

- 11 -

TABLE 1.6

Classification of vine varieties according to the uses to which the grapes obtained are normally put.
General rules: Regulation (EEC) No 2389/89)

N.B.: - Areas under vine varieties for the production of other wine mainly comprises table wine, including regional wines
- Regulations (EEC) Nos 2389/89 and No 3800/81 specify the uses of the grapes without, however, making a link with the under vines in view of the notes given in Table 1.5 any allocation of area according to use is approximate.

TABLE 1.7

Classification of areas under vines according to status of production

Area in production	Area not yet in production (planted with young vines)	Set-aside areas under vines (areas not maintained and not harvested, abandoned but not grubbed)	Areas with rights	or	Existing rights (*)
Total area under vines					
Potential area under vines					

N.B.: - Only areas indicated in bold and italics are available in Eurostat publications
 (*) Pursuant to Article 7 of Regulation (EEC) No 822/87, planting rights may be linked either to area (plots) or to a producer; rights remain valid for eight wine years.

TABLE 1.8

Factors determining trend of areas

AREAS IN PRODUCTION AT START OF WINE YEAR C-1	
-	GRUBBING of areas in production during C-1
+	PLANTING (replanting or new planting) carried out during year C-3
<hr/>	
=	AREAS IN PRODUCTION IN WINE YEAR C
+	areas set aside during year C
+	planting carried out during years C-2 and C-1
<hr/>	
=	TOTAL AREA UNDER VINES IN YEAR C
+	Rights in hand:
	♦ replanting rights for years C-7 to C
	♦ new planting rights for years C-2 to C
<hr/>	
=	POTENTIAL AREA UNDER VINES IN YEAR C

N.B.:

- Monitoring of planting rights presupposes an operational vineyard register (Regulation (EEC) No 2392/86)
- The difference between areas grubbed and areas replanted must be greater than or equal to areas permanently abandoned (for which a grubbing premium has been granted)
- Grubbings are deemed to correspond to grubbings of areas in production
- The duration of non-productive status depends on the type of planting; for the purposes of the report, a vineyard is deemed to come into production in the third year after planting

N.B.: The variation rate is the difference between the areas recorded during the second basic survey and:

- the area of the variety surveyed during the first basic survey (absolute)
- the total of areas surveyed during the first basic survey (relative)
- the total of areas of the same colour surveyed during the first basic survey (by colour)
