## **PRICE AND COST COMPETITIVENESS**

DG II-C-1

Fourth quarter 1998

### **Quarterly report on the price and cost competitiveness of the European Union and its Member States**

# PRICE AND COST COMPETITIVENESS

## QUARTERLY REPORT –FOURTH QUARTER 1998

This report provides a periodic assessment of the price and cost competitiveness of the European Union (EUR15), the group of countries participating in the Exchange Rate Mechanism (ERM), the 15 EU Member States individually, as well as 5 other industrial countries<sup>1</sup>. It appears quarterly<sup>2</sup> and consists of two parts. *Part 1* offers an overview of recent developments. *Part 2* provides detailed information for each country.

The **nominal effective exchange rate (NEER)** aims to track changes in the value of a nation's currency relative to the currencies of its principal trading partners. It is calculated as a weighted average of the bilateral exchange rates with those currencies.

The **real effective exchange rate (REER)** aims to assess a nation's price or cost competitiveness relative to its principal competitors<sup>3</sup> in international markets. It corresponds to the NEER deflated by selected relative (or 'effective') price or cost deflators. **The discussion in *Part 1* focuses on real rates based on unit labour costs in the manufacturing sector and in the whole economy.** *Part 2* of the report presents real rates based on the deflator of private consumption, the GDP deflator, the price deflator of exports of goods and services (PX), unit labour costs in the whole economy (ULCE); as well as unit labour costs in manufacturing (ULCM).

**1987 is taken as the base period** for the various indicators of price and cost competitiveness. That year saw the conclusion of the Louvre accord, which aimed at greater exchange rate stability between the USD, the JPY and the DEM. It also marked the beginning of a period of exchange-rate stability within the Exchange rate Mechanism of the European Monetary System that lasted until September 1992. This does not imply that 1987 exchange rates should be treated as equilibrium rates.

***Part 1* of the report focuses on developments in the European Union, the United States and Japan.** It consists of two main sections. The *first section* describes the changes observed in the cost competitiveness of the US, Japanese and EU economies relative to 23 industrial countries. The bilateral position of the European Union relative to the United States and Japan is also examined. The *second section* comments on exchange rate developments within the European Union.

**The quarterly report is also available on the Internet. Our Web site, “<http://europa.eu.int/comm/off/rep/pccr/>”, permits the downloading of standard statistics to your PC or Macintosh.** Moreover, differently defined nominal and real exchange rates are available upon request. A technical annex provides further details.

<sup>1</sup> Norway, Australia, Canada, Japan and the United States.

<sup>2</sup> Due to delays in the production of the data for the second quarter, this report covers the second and third quarters together. The report for the fourth quarter of 1998, which is due in January 1999, will contain data on the nominal and real effective exchange rates of the euro area.

<sup>3</sup> In this report three alternative groups of competitor countries are considered: 23 industrial countries (IC 23), the 15 Member states of the European Union (EUR 15) and the 12 participants in the Exchange Rate Mechanism (ERM).

### Technical Annex

**PART 1**

**DEVELOPMENTS IN  
THE COST COMPETITIVENESS OF  
THE EUROPEAN UNION,  
THE UNITED STATES AND JAPAN**

## **DEVELOPMENTS IN THE COST COMPETITIVENESS OF THE EUROPEAN UNION, THE UNITED STATES AND JAPAN**

### **MAIN FEATURES**

#### **In the fourth quarter of 1998:**

- The EU currencies appreciated by 5% against the US dollar but fell by 10.5% against the Japanese yen. These currency movements contributed to a small gain (about 1%) in the Union's average cost competitiveness relative to 9 non-EU industrial countries. For the countries participating in the euro area (EUR11)<sup>1</sup>, cost competitiveness worsened by about 1% relative to 13 non-EMU countries.
- Within the EU, exchange rate depreciation led to competitiveness gains in Sweden and the UK relative to the rest of the EU (by 3% or more). Partly as a result, the cost competitiveness of Denmark, France, Spain and Finland deteriorated by between 1 and 2½%.

#### **Since the fourth quarter of 1997:**

- The EU currencies have appreciated by 4% against the US dollar but they have depreciated by 1% against the Japanese yen. These currency movements contributed to a 2% loss in the Union's average cost competitiveness relative to 9 non-EU industrial countries. The EUR11 suffered a loss of 2% relative to 13 non-EMU countries.
- Countries whose currencies have depreciated inside the EU (Greece, Ireland, Sweden and the UK) have gained intra-EU cost competitiveness. In most other Member States, cost competitiveness has deteriorated. Denmark experienced the largest competitiveness loss relative to other EU countries, partly due to relatively high growth in unit labour costs.

#### **Since 1987:**

- The EU currencies depreciated on average by ½% against the US dollar and by 17½% against the Japanese yen. These currency movements contributed to a 5% gain in the Union's cost competitiveness in manufacturing relative to 9 non-EU industrial countries. If unit labour costs are measured for the whole economy, the improvement in cost competitiveness amounts to 2%. The EUR11 has seen a decline in relative unit labour costs of around 11%, both in manufacturing and the economy as a whole.

#### **Notes on the euro and on the international currency turmoil**

The Third Stage of Economic and Monetary Union began on 1.1.1999. The introduction of the euro will be reflected in future Quarterly Reports. This report contains an annex on the historical effective exchange rate indices for the EUR11.

During 1997 and 1998, the currencies of several emerging market countries weakened very substantially. However, since not all the necessary data are available for these countries, they are not taken into account in the competitiveness measures in this report.

## PRICE AND COST COMPETITIVENESS

### QUARTERLY REPORT – FOURTH QUARTER 1998

#### I. INTERNATIONAL DEVELOPMENTS

##### 1. BILATERAL EXCHANGE RATES: THE USD, JPY AND DEM

The U.S. dollar fell sharply from around DEM 1.80 in mid-August to DEM 1.65 (-8%) by 1 October. The decline in the USD was related to the international financial turmoil that followed the currency crisis in Russia and led to expectations of lower US interest rates. Subsequently, as interest rates were seen to come down also in Europe, the USD/DEM rate stabilised. The USD/DEM rate was broadly unchanged during the fourth quarter (see Table 1).

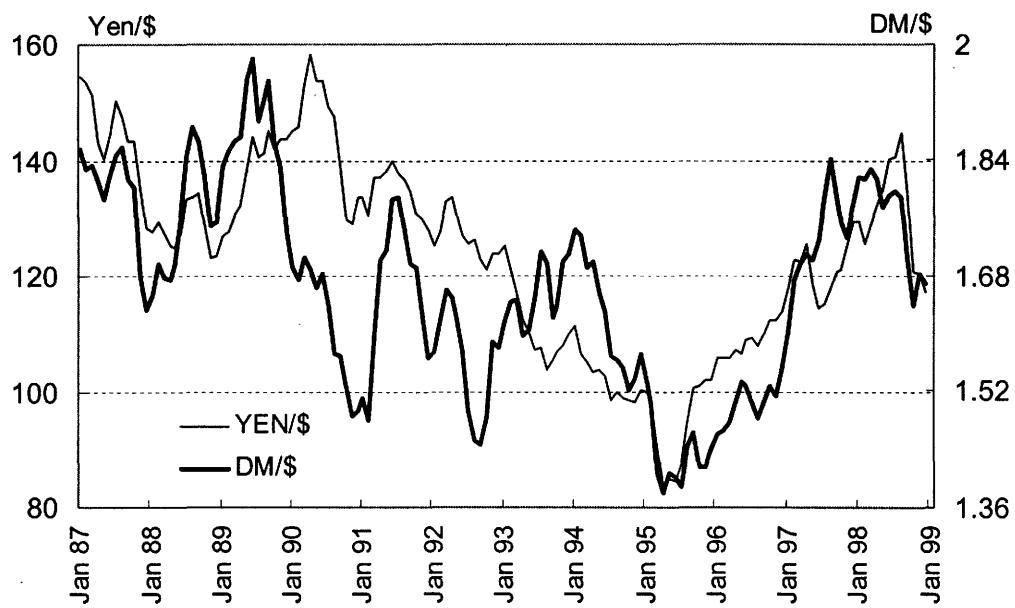

The Japanese yen strengthened from around JPY 135 per USD to JPY 117 (14%) in the space of just 2 days in early October, notwithstanding the poor state of the Japanese economy. The rebound was related to technical factors (in particular, repatriation by Japanese financial institutions of USD assets) but the JPY/USD rate remained at the higher level, ending the year at around 114 JPY per USD.

**TABLE 1: EVOLUTION OF MAIN BILATERAL EXCHANGE RATES**

## 2. NOMINAL EFFECTIVE EXCHANGE RATES (RELATIVE TO 23 INDUSTRIAL COUNTRIES)

In the fourth quarter of 1998, the nominal effective exchange rate of the US dollar depreciated by 5% as the currency weakened against the Japanese yen, the EU currencies, and some other currencies. The weakening of the US-dollar marked a reversal of the rising trend since the spring of 1995.

The Japanese yen, which had come down from its peak in early 1995, appreciated by almost 15% in nominal effective terms in the fourth quarter of 1998.

For EUR15, the weaker USD and the stronger JPY tended to cancel each other out, and the nominal effective exchange rate of the EUR15 appreciated by a mere 0.3%.

GRAPH 2: NOMINAL EFFECTIVE EXCHANGE RATES  
RELATIVE TO 23 INDUSTRIAL PARTNERS SINCE 1987

Note: Since the reference group includes 7 countries in addition to those shown in the graph, it is possible for the EUR15, USA and Japan to experience an appreciation (depreciation) of their nominal effective exchange rate at the same time. The large depreciation of some currencies (in particular the Mexican peso and the Turkish lira) since 1987 has resulted in a long-term appreciation of the nominal effective exchange rate for EUR15, USA and Japan.

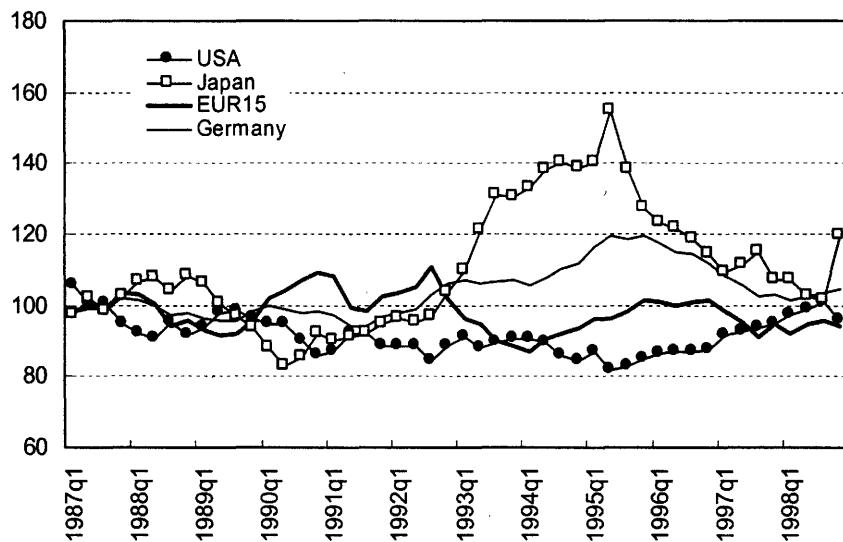

Index 1987=100. Source: European Commission

### 3. REAL EFFECTIVE EXCHANGE RATES (RELATIVE TO 23 INDUSTRIAL COUNTRIES)

In the fourth quarter of 1998, the cost competitiveness of the USA improved by 4½-5% (depending on whether unit labour costs are measured in the manufacturing sector or the economy as a whole<sup>2</sup>, cf. Table 2). For EUR15, an improvement in relative unit labour costs led to a small gain in cost competitiveness by ½-1½%. For Japan, the stronger yen translated into a 13-18% deterioration in cost competitiveness (according to the measure used).

Since the fourth quarter of 1997, all of the three major areas have lost cost competitiveness. This unusual situation reflects the large real effective depreciation for some of the remaining currencies in the reference group, namely the Canadian, Australian and New Zealand dollar, the Norwegian krone, and the Mexican peso. When relative unit labour costs in the economy as a whole are considered, the real effective exchange rate appreciation since 1997Q4 amounts to 1½% for Japan, 2% for EUR15 and 3% for the USA.

GRAPH 3: REAL EFFECTIVE EXCHANGE RATES (1)  
RELATIVE TO 23 INDUSTRIAL PARTNERS SINCE 1987

(1) Deflated by Unit Labour Costs in Manufacturing Industry. Index 1987=100. Source: European Commission

<sup>2</sup> Most international trade is in manufactured goods and, in order to measure and analyse cost competitiveness, it may seem natural to focus on costs in the manufacturing industry. However, data on unit labour costs in manufacturing industry are subject to larger statistical revisions than are data on unit labour costs in the whole economy, and may be less comparable across countries. Moreover, labour costs account for only a limited share of total costs in the manufacturing industry. The sector purchases a growing amount of inputs from the rest of the economy, including from service sectors such as financial services, marketing, etc. In addition, an increasing amount of services are traded internationally. To enhance the picture of movements in cost competitiveness, it is therefore necessary also to consider developments in unit labour costs in the whole economy. Moreover, capital costs account for a sizeable fraction of total costs, and one should also take into account measures which include these costs. The GDP-deflator includes the return on capital, but also indirect taxes.

Source : European Commission

(1) NEER = Nominal Effective Exchange Rate. A negative sign indicates a depreciation of the NEER.

(2) ULC = Relative Unit Labour Costs (in national currency).

(3) REER = Real Effective Exchange Rate = relative unit labour costs (in common currency).

A minus means an improvement in cost competitiveness.

#### 4. COST COMPETITIVENESS OF THE EU RELATIVE TO THE USA AND JAPAN

In the fourth quarter of 1998, the strengthening of the European currencies (EUR15) against the dollar led to a loss of cost competitiveness relative to US producers of around 4½%. The depreciation of the European currencies against the yen overshadowed differences in the rate of increase in unit labour costs and led to a gain of European (EUR15) cost competitiveness by 9-13% relative to Japan (according to the measure used, cf. Table 3).

TABLE 3: COST COMPETITIVENESS OF THE EUROPEAN UNION  
RELATIVE TO THE UNITED STATES AND JAPAN

(1) NEER = Nominal Effective Exchange Rate. A negative sign indicates a depreciation of the NEER.

(2) ULC = Relative Unit Labour Costs (in national currency).

(3) REER = Real Effective Exchange Rate = relative unit labour costs (in common currency).

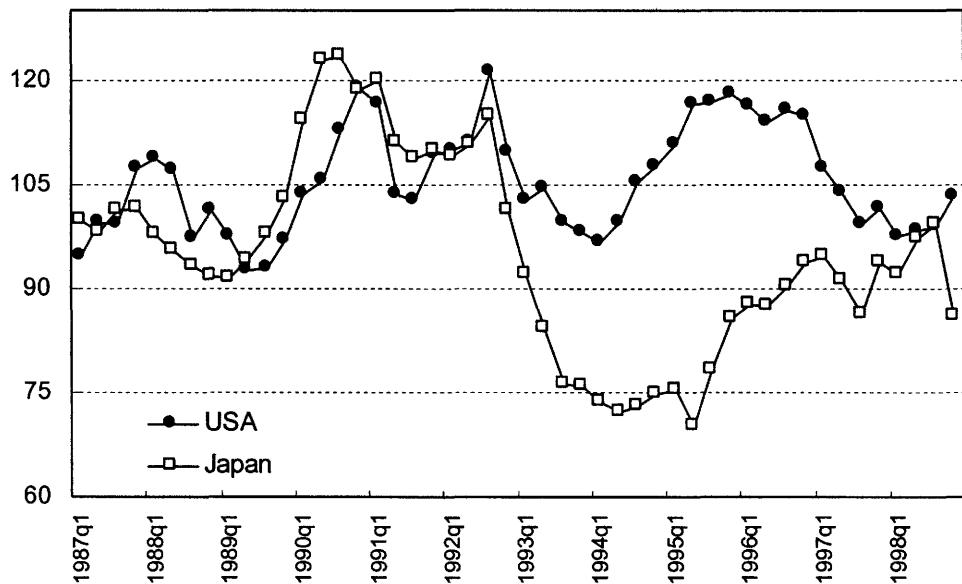

A minus means an improvement in European cost competitiveness.

## **II. INTRA-UNION DEVELOPMENTS**

**In the fourth quarter of 1998**, in the run-up to the third stage of Economic and Monetary Union, exchange rates were stable within the Exchange Rate Mechanism. However, the two currencies which do not participate in the ERM, namely the pound sterling and the Swedish krona, experienced a depreciation of around 4½% relative to the rest of the EUR15 (see Table 4). This led to a nominal effective appreciation for the ERM countries in the range of ½-1½%. The largest appreciation occurred in countries such as Denmark, Finland and Germany where trade with Sweden and the UK plays a significant role.

Depreciation led to cost competitiveness gains in Sweden and the UK (3% economy-wide and even more for unit labour costs in manufacturing). In Italy, a shift in taxes from labour to value-added lowered relative unit labour costs there, but it is not obvious whether this shift should be considered an improvement in competitiveness<sup>3</sup>. The real effective exchange rates of Denmark, France, Spain and Finland appreciated by between 1 and 2½% relative to EUR15.

**Since the fourth quarter of 1997**, the pound sterling has depreciated by 3½% relative to the other Member States, from a high level. The Swedish krona depreciated by 8½% as it was hit by contagion from the global financial turbulence. The Greek drachma has depreciated by 6%, reflecting the impact of its devaluation on entering the ERM on 16 March 1998. The Irish pound has depreciated by 2½% as it gradually came down to its ERM central rate in anticipation of the third stage of EMU. All other Member States recorded an appreciation of their currency relative to the EUR15.

The countries whose currencies depreciated inside the EU (Greece, Ireland, Sweden and the UK) also experienced an improvement in competitiveness over the period. In addition, relative unit labour costs decreased markedly in Italy due to the tax shift mentioned above. In all remaining Member States, cost competitiveness deteriorated or was broadly unchanged. Denmark saw the largest loss in competitiveness (about 4½-5%) due to a large exposure to trade with Sweden and the UK, but mainly due to relatively high growth of unit labour costs.

---

<sup>3</sup> This shift in taxation took effect from the beginning of 1998 but is distributed across the year in the quarterly data.

## ANNEX: THE EFFECTIVE EXCHANGE RATE OF THE EURO AREA (EUR11)

On 1 January 1999, the euro became the single currency of 11 EU Member States<sup>4</sup>. This change will be reflected in future Quarterly Reports, beginning with the report for the first quarter 1999 (due in April 1999). Nominal and real effective exchange rates will be included for the euro area (EUR11), but the effective exchange rate indices will continue to be calculated for individual euro area participants, using the same weighting scheme as in the past<sup>5</sup>. This box gives a preview of the historical data for the effective exchange rates of the EUR11 area.

### *Calculating the EUR11 effective exchange rate*

With the euro in operation, the market rates of the euro against other currencies can be used to calculate a nominal effective exchange rate index of the euro area starting from 1.1.1999. The area is treated as one economic entity and the weights are based on extra-EUR11 trade. To calculate the *real* effective exchange rate, the cost (or price) deflator of EUR11 is calculated as an average of the deflators of individual EMU members using their share in extra-EMU trade as weights.

One may calculate historical series for the effective exchange rate indices of the EUR11. These "synthetic" data should *not* be taken as the history of the euro: they are merely an average of the 11 currencies which the euro replaces. The euro will have different economic properties than might be indicated by such an average. In particular, the euro countries now share a single monetary framework aimed at maintaining price stability. In many respects, the euro is more likely to behave as the strongest and most stable of the currencies that it replaces than as the average (especially as concerns the nominal rate).

Nevertheless, the *real* effective exchange rate indices for EUR11 are helpful in assessing the euro area's competitiveness at current exchange rates, costs and prices in a historical perspective. The EUR11 effective rates are calculated by weighing together the real effective exchange rates of each EMU-member calculated *relative to non-EMU countries*, with the weights depending on each member's share in total extra-EMU trade.

### *Double export weights for the EUR11 indices*

The standard reference group in the Commission services' calculations of effective exchange rates consist of 24 countries, namely the 11 EMU members and 13 other countries (see table). For an individual EMU member, trade with the 23 partner countries covers a large share of its total trade (typically around 80%). For the EUR11 as a whole, however, intra-EUR11 trade is disregarded, and exports to the 13 remaining countries only cover around 60% of total extra-EUR11 exports.

<sup>1</sup>The share of each country in total EUR11 exports to the 13 countries. Exports to the 13 countries amounted to 59% of total extra-EUR11 exports.

<sup>4</sup> EUR11 : Belgium, Germany, Spain, France, Ireland, Italy, Luxembourg, Netherlands, Austria, Portugal, Finland

<sup>5</sup> Since there is no longer any exchange rate between countries sharing the same currency, the nominal effective exchange rate of individual euro participants will be referred to as the *trade-weighted currency index*. These indices may evolve differently for different euro area countries because of dissimilarities in their trading patterns. The real effective exchange rate measures will be referred to as *relative cost (or price) indicators*. These indices may further deviate between euro participants due to diverging price and cost developments.

The table shows that the UK and US markets are by far the largest destinations of euro-area exports, followed with some distance by Switzerland, Japan and Sweden.

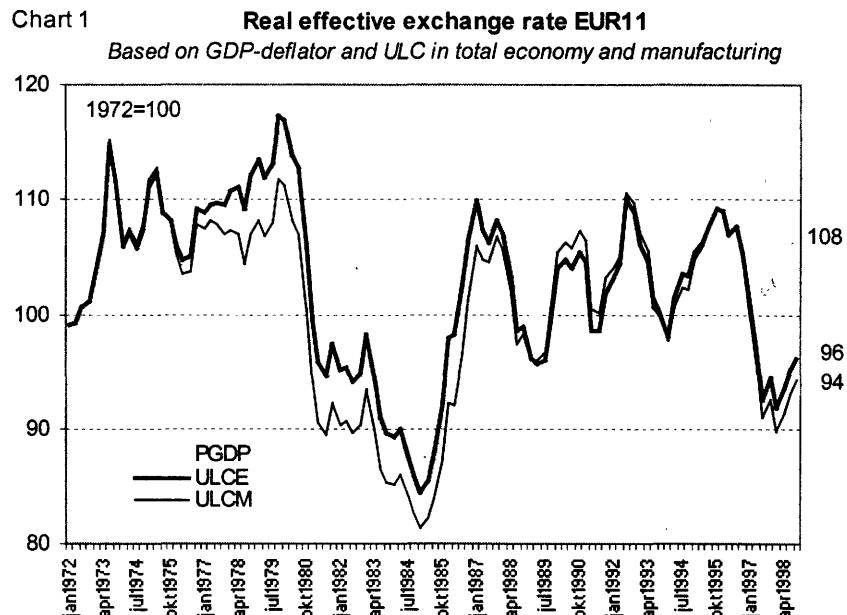

The double export weights used in the calculation of the effective exchange rates recognise that the 24 countries compete against each other in their own markets and on all other markets around the globe. Because US and Japanese producers have a strong presence in many non-EUR11 markets (including in Latin America and South East Asia), their weight is higher than indicated by the bilateral trade flows with the EUR11. The US surpasses the UK as the largest competitor, and Japan overtakes Switzerland as the third largest. In most other cases, the differences with the bilateral weights are moderate.

#### *Trends in the EUR11 real effective exchange rate*

Chart 1 shows the development since 1972 of various measures of the real effective exchange rate of the EUR11 group of countries. The long-term trend differs between the measures based on unit labour costs and that based on the GDP-deflator. By the fourth quarter of 1998, relative unit labour costs were below their long-term average, while relative GDP-prices were above.

Part of the explanation for this divergence may be that companies in EUR11 have been induced to adopt relatively more capital-intensive technologies (due to the high cost of labour and other factors) and this has led to rising capital costs which are reflected in the GDP-deflator but not in the ULC measures.

If this is the case, the measure based on the GDP-deflator may give the best indication of relative cost trends. On the other hand, trends in profitability may have been stronger in EUR11, which could be a sign of improving (non-price) competitiveness, and indirect tax increases may also have been more prominent in EUR11. About half of the gap between the ULC and GDP-based measures emerges during 1996-98, and may in part be due to special factors.

Whatever measure is used, chart 1 shows an improvement in EUR11 cost competitiveness between mid-1995 and late 1997. The EUR11 currencies fell relative to the US-dollar, the pound sterling and other currencies, and significant cost-cutting took place in some EUR11 countries. At the same time, wage and price increases were increasingly subdued. However, subsequent exchange rate developments have contributed to a significant worsening of price competitiveness, by 4-7% between 1997Q3 and 1998Q4 depending on the deflator used. During the 1998Q4, average cost competitiveness of the EU 11 worsened by more than 1%.

The series for the EUR11 effective exchange rates are available on the Commission Services' web-site: "<http://europa.eu.int/comm/off/rep/pccr>".

**PART 2**

**TABLES AND GRAPHS  
BY COUNTRY**

## **PART 2:**

### **TABLES AND GRAPHS BY COUNTRY**

The tables and graphs on **Pages 1 to 40** present nominal and real effective exchange rates of the currencies of the European Union Member States and five other industrial countries. Aggregate measures for the European Union as a whole (EUR15) and the group of countries participating in the Exchange Rate Mechanism (ERM) are presented as well. Each country (or country group) is compared with 23 industrial countries (the 15 EU countries, Norway, Australia, Canada, Japan, the United States, Mexico, New Zealand, Turkey and Switzerland), with the European Union and with the group of ERM participants.

The tables on **Pages 41 to 58** present bilateral exchange rates of the US dollar against the currencies of the 23 industrial countries; and nominal and real effective exchange rates of the EU currencies, the US dollar and Japanese yen (as well as aggregate measures for EUR15 and the ERM). Each cross-national table of real effective exchange rates is based on a single price or cost deflator. Price and cost indices in national currency are presented as well. These tables aim to facilitate a comparison of developments in the different industrial countries. The final table shows the latest double export weight matrices that were used to calculate effective exchange rates.<sup>1</sup>

Abbreviations: IC23 = 23 Industrial Countries  
 EUR15 = 15 Member States of the European Union  
 ERM = Countries in the Exchange Rate Mechanism  
 CPI = Consumer Price Index  
 GDP = Gross Domestic Product Deflator  
 PX = Price Deflator Exports of Goods and Services  
 ULCE = Nominal Unit Labour Cost in total Economy  
 ULCM = Nominal Unit Labour Cost in Manufacturing industry

Abbreviations: IC23 = 23 Industrial Countries  
 EUR15 = 15 Member States of the European Union  
 ERM = Countries in the Exchange Rate Mechanism  
 CPI = Consumer Price Index  
 GDP = Gross Domestic Product Deflator  
 PX = Price Deflator Exports of Goods and Services  
 ULCE = Nominal Unit Labour Cost in total Economy  
 ULCM = Nominal Unit Labour Cost in Manufacturing industry

**Table A1: Bilateral exchange rate of the US dollar against the EU currencies**  
**(Price of one US dollar in terms of the currencies of each of the countries indicated)**

## TECHNICAL ANNEX

### **INTRODUCTION**

The quarterly report on price and cost competitiveness presents recent changes in the nominal and real effective exchange rates of the 14 EU currencies<sup>1</sup>, Norway, Australia, Canada, Japan and the United States. Aggregate measures for the European Union (EUR15) and the group of countries participating in the Exchange Rate Mechanism (ERM) are presented as well.

The nominal effective exchange rate (NEER) describes changes in the average value of a currency with reference to a given base period and a given group of reference countries. It is calculated as a weighted geometric average of the bilateral exchange rates against the currencies of competing countries. In this report, three alternative groups of competitor countries are considered: a group of 23 industrial countries (IC23), the 15 Member states of the European Union (EUR15) and the group of countries participating in the Exchange Rate Mechanism (ERM).

The real effective exchange rate (REER) is the main indicator of price and cost competitiveness. It is calculated as the sum of the nominal rate and a trade-weighted price or cost deflator. The REER attempts to show the movement in the prices or costs of production of domestically produced goods relative to the prices or costs of goods produced by competitor countries, when expressed in a common currency.

Double export weights are used to calculate NEERs and REERs, reflecting not only competition in the home markets of the various competitors, but also competition in export markets elsewhere.

Our computer programme permits each user to make his own choice of competitor countries, reference period, method to calculate trade weights and, in the case of real effective exchange rates, price or cost deflators. This technical annex describes the choices made in this report. Differently defined nominal and real exchange rates can be provided to interested persons or organisations upon request. Please fax your request to the European Commission, Directorate-General for Economic and Financial Affairs (DG II-D-4), fax n° 32-2-299.35.05, or consult our web site "<http://europa.eu.int/comm/off/rep/pcer/>".

### **METHOD**

#### **1. Choice of reference period**

The choice of the reference period in assessing developments in nominal and real effective exchange rates is necessarily arbitrary and should not be seen as implying that exchange rates prevailing in this reference period were in equilibrium.

---

<sup>1</sup> The Belgium Luxembourg Economic Union (BLEU) uses a single currency.

**2. Calculation and application of trade weights  
(that transform the bilateral exchange rates into effective exchange rates)**

The trade weights used are double export weights. This implies that the bilateral exchange rates between the currency of a given country and the currencies of its competitor countries are weighted according to both:

- (1) the competitors' share in the total supply of competing goods (including the supply by domestic producers) in each market separately; and
- (2) the relative share of each market in the total exports of the given country.

The weight matrices of year t-1 are used to calculate the change in the effective exchange rate between the year t and t-1. If no weights are available for the year t-1, the weights of the latest year available are used.

**3. Price and cost deflators  
(to transform the nominal effective exchange rates into real effective rates)**

Five real effective exchange rates (each based on a different deflator) have been calculated in order to provide a comprehensive assessment of a country's price and cost competitiveness. The following deflators have been used:

- (1) the deflator of private consumption;
- (2) the GDP deflator;
- (3) the price deflator of exports of goods and services (PX);
- (4) Unit Labour Costs in Economy as a whole (ULCE); and
- (5) Unit Labour Costs in Manufacturing (ULCM).

**4. German unification**

The competitiveness indicators presented here reflect developments in unified Germany wherever possible. In practice, this means that pan-German data are used to calculate the weight matrices. The deflators, however, are unified only from 1995 on. Earlier data concern western Germany only. Consequently, the transitional high rates of inflation observed in the new German Länder after unification (between 1991 and 1994) are not reflected in the real effective exchange rate of the German mark as presented in this report. The introduction of pan-German data causes a break not only in the German series, but also in all other series of effective exchange rates because of Germany's role as a competitor. However, a break in the series is technically unavoidable and a reflection of reality.

## **DATA SOURCES**

### **1. Nominal bilateral exchange rates and deflators**

Exchange rate data are taken from DGII's TXI data base. TXI contains the official daily rates recorded at 14.15 hours. Monthly figures are calculated as the arithmetic mean of the daily rates. Quarterly and yearly data are geometric means of these monthly figures.

Annual data for the deflators (including Commission forecasts for the current year) come from DGII's AMECO data base. As the calculation of real effective exchange rates requires a full data set, missing data have been estimated. The annual data have been transformed into quarterly data by applying a straight-forward spline method.

### **2. Weight matrices:**

The double export weight matrices are derived from trade matrices with domestic production for the home market on the diagonal. The source of data on bilateral exports is the DoT (IMF) data base. The source of data on domestic production (defined as GDP - exports) is national accounts' data from AMECO. Table H in Part 2 of the report reproduces the most recent weight matrices used in calculating effective exchange rates. In this report the latest weight matrices available are those of 1995.

## **COUNTRY COVERAGE**

### **1. Competitors**

The report presents nominal and real effective exchange rates relative to a group of 23 industrial countries (IC23), relative to the European Union as a whole (EUR15) and relative to the group of countries participating in the Exchange Rate Mechanism. IC23 consists of the 19 economies for which competitiveness indicators are calculated (see Introduction) plus Mexico, New Zealand, Turkey and Switzerland.

### **2. Markets**

Besides the countries considered as competitors, the following markets are distinguished: other Europe (including the Central and Eastern European Countries and the countries that used to be part of the USSR), other Asia/Oceania, other Western hemisphere, Africa, the Middle East and the rest of the World (including North Korea and Cuba). The conventions used in DoT/IFS (IMF) are followed strictly with two exceptions: (1) the industrial countries are not treated as a separate category; (2) the former East and West Germany are considered as a single entity: Germany.
