## NOTES ON COUNTRY TABLES D (CONTRIBUTIONS TO THE CHANGES IN GENERAL GOVERNMENT GROSS DEBT)

The budgetary constraint for a country can be expressed by the following equation:

$$\frac{D_t}{Y_t} - \frac{D_{t-1}}{Y_{t-1}} = \frac{NB_t}{Y_t} - y_t \frac{D_{t-1}}{Y_t} + \frac{SF_t}{Y_t},$$

where  $D_t$  = general government gross debt at the end of year 't';  $NB_t$  = general government net borrowing in year 't';  $SF_t$  = stock-flow adjustment;  $Y_t$  = nominal GDP in year 't';  $y_t$  = nominal GDP growth rate in year 't'.

The stock-flow adjustment ensures the consistency between net borrowing (flow) and the variation in the stock of debt. It includes the accumulation of financial assets, the changes in the value of debt denominated in foreign currency and remaining statistical adjustments.

This equation can be rearranged as:

$$\frac{D_t}{Y_t} - \frac{D_{t-1}}{Y_{t-1}} = \frac{NB_t}{Y_t} - \frac{y_t}{1+y_t} \frac{D_{t-1}}{Y_{t-1}} + \frac{SF_t}{Y_t}$$

The contributions to changes in general government gross debt in the Member States and the Community are presented in tables D in accordance with this equation. Line 9 in tables D shows net borrowing expressed as a percentage of GDP ( $\frac{NB_t}{Y_t}$ ). Line 10 presents the

impact of nominal GDP growth on the change in the debt ratio ( $\frac{-y_t}{1+y_t} \frac{D_{t-1}}{Y_{t-1}}$ ), and the impact of the residual factors referred to as the stock-

flow adjustment ( $\frac{SF_t}{Y_t}$ ) is given by line 13. The addition of these three contributions gives the annual change in the debt ratio ( $\frac{D_t}{Y_t} - \frac{D_{t-1}}{Y_{t-1}}$ ) in line 14.

### **Aggregation for the Community**

The stock-flow adjustment figures shown in tables D for Community aggregates comprise, besides the weighted average of the stock-flow adjustments of the Member States considered, the influence of exchange rate movements on the preceding year's national stocks of debt expressed in ECU. These exchange rate effects on Community aggregates, which may at times be sizeable, appear in the Community stock-flow adjustment because of its calculation as a residual.

## NOTES ON GROSS DOMESTIC PRODUCT

Whenever government data are expressed in terms of gross domestic product, they have been calculated with reference to the most recent GDP data available. This GDP data is presented in table 51A entitled "gross domestic product at current market prices (reference for calculation)". These time series may, however, contain breaks because revisions have not always been carried through for all the preceding years. As GDP growth rates are seriously influenced whenever such breaks occur, GDP growth rates presented in lines 1 to 3 of tables D are based on a linked GDP time series.

## NOTES ON GENERAL GOVERNMENT GROSS DEBT DATA

Definition : General government consolidated gross debt defined by article 1 (5) of Council Regulation (EC) N° 3605/93 of 22 November 1993.

Article 1 (5) :

" Government debt means the total gross debt at nominal value outstanding at the end of the year of the sector of general government (S60), with the exception of those liabilities the corresponding financial assets of which are held by the sector of general government (S60).

Government debt is constituted by the liabilities of general government in the following categories: currency and deposits (F20 and F30), bills and short-term bonds (F40), long-term bonds (F50), other short-term loans (F79) and other medium and long-term loans (F89) as defined in ESA.

The nominal value of a liability outstanding at the end of the year is the face value.

The nominal value of an index-linked liability corresponds to its face value adjusted by the index-related capital uplift accrued to the end of the year.

Liabilities denominated in foreign currencies shall be converted into the national currency at the representative exchange rate prevailing on the last day of each year "
