NOTES ON COUNTRY TABLES D

CONTRIBUTIONS TO CHANGE IN THE GENERAL GOVERNMENT GROSS DEBT RATIO

15. The budgetary constraint for a country can be expressed by the following equation:

$D_t = D_{t-1} + NB_t + SF_t$, or $\frac{D_t}{Y_t} = \frac{D_{t-1}}{Y_{t-1}} \cdot \frac{1}{1+y_t} + \frac{NB_t}{Y_t} + \frac{SF_t}{Y_t}$, where D_t = general government gross debt; NB_t = general government deficit (net borrowing); Y_t = GDP at current market prices, y_t = nominal GDP growth rate and SF_t = stock-flow adjustment. The t subscript denotes the year.

The equation can be presented as $\frac{D_t}{Y_t} - \frac{D_{t-1}}{Y_{t-1}} = \frac{NB_t}{Y_t} - \frac{D_{t-1}}{Y_{t-1}} \cdot \frac{y_t}{1+y_t} + \frac{SF_t}{Y_t}$ (1)

showing the decomposition of the change in the gross debt ratio in deficit, contribution of nominal GDP growth and stock-flow adjustment.

The equation may also be presented emphasizing the role of the primary deficit:

$D_t = D_{t-1} \cdot (1+i_t) + PD_t + SF_t \Leftrightarrow \frac{D_t}{Y_t} = \frac{D_{t-1}}{Y_{t-1}} \cdot \frac{1+i_t}{1+y_t} + \frac{PD_t}{Y_t} + \frac{SF_t}{Y_t}$, where we define PD_t = primary deficit and i_t = effective interest rate.

It may be rearranged as $\frac{D_t}{Y_t} - \frac{D_{t-1}}{Y_{t-1}} = \frac{PD_t}{Y_t} + \frac{D_{t-1}}{Y_{t-1}} \cdot \frac{i_t - y_t}{1+y_t} + \frac{SF_t}{Y_t}$ (2)

showing the change in the gross debt ratio as primary deficit, snow-ball effect and stock-flow adjustment.

The contributions to changes in the gross debt ratio in the Member States and the Community are presented in Tables D in accordance with (1) and (2) in lines 5, 6 and 7, and 8, 9 and 10, respectively.

STOCK FLOW ADJUSTMENT

16. The stock-flow adjustment ensures the consistency between net borrowing (flow) and the variation in the stock of gross debt. It includes the accumulation of financial assets, the changes in the value of debt denominated in foreign currency and remaining statistical adjustments.

The stock flow adjustment figures shown in tables D for the Community aggregates comprise, besides the weighted average of the stock-flow adjustments of the Member States considered, the influence of exchange rate movements on the preceding year's national stock of gross debt expressed in ECU. These exchange rates effects on Community aggregates, which may at times be sizable, appear in the Community stock-flow because of its calculation as a residual.

NOTE ON GROSS DOMESTIC PRODUCT

17. Whenever government data (e.g. government debt) are expressed in terms of gross domestic product, they have been calculated with reference to the most recent GDP data available. This GDP is presented in table 51A entitled "gross domestic product at current market prices (reference for calculation)". These series may, however, contain breaks because revisions have not always been carried through for all the preceding years. As GDP growth rates are seriously influenced by such breaks, nominal GDP growth rates presented in line 4 of tables D, are based on a linked GDP time series. This is also the case for the contribution of nominal GDP growth to the change in the debt ratio (line 6) and the snow-ball effect (line 9). Therefore, whenever a break in the GDP time series occurs, the change in gross debt (line 11) does not strictly correspond to the total of lines 5 to 7 or 8 to 10.

NOTE ON GENERAL GOVERNMENT GROSS DEBT DATA

18. General government consolidated gross debt is defined by article 1 (5) of Council Regulation (EC) N° 3605/93 of 22 November 1993:

" Government debt means the total gross debt at nominal value outstanding at the end of the year of the sector of general government (S60), with the exception of those liabilities the corresponding financial assets of which are held by the sector of general government (S60).

Government debt is constituted by the liabilities of general government in the following categories: currency and deposits (F20 and F30), bills and short-term bonds (F40), long-term bonds (F50), other short-term loans (F79) and other medium and long-term loans (F89) as defined in ESA.

The nominal value of a liability outstanding at the end of the year is the face value.

The nominal value of an index-linked liability corresponds to its face value adjusted by the index-related capital uplift accrued to the end of the year.

Liabilities denominated in foreign currencies shall be converted into the national currency at the representative exchange rate prevailing on the last day of each year "
