

Commission decision of...establishing an inventory
and a common nomenclature of ingredients employed
in cosmetic products 1995.

SECTION II - Perfume and aromatic raw
materials by EINECS Nos.

VOL. III

SECTION II

PERFUME AND AROMATIC RAW MATERIALS

1. Introduction

These lists are representative of the basic materials used in perfumes and aromatic compositions. The lists were compiled mainly on the basis of information provided by EFFA (European Flavour and Fragrance Association). They constitute the inventory of fragrance ingredients.

2. Identity of fragrance ingredients

Fragrance ingredients do not need a common nomenclature because the fragrance or their ingredients (perfume and aromatic compositions and their raw materials) must be indicated on the labels using the words "perfume" or "flavour" (Article 6(1)(g) of the Cosmetic products Directive). Hence the information on the identity of these substances consists of a chemical name identifying the substances in the clearest possible way. Such a system already exists in the "acquis communautaire" - namely the EINECS inventory ("European Inventory of Existing Commercial Chemical Substances"), (Official Journal of the European Communities No C 146A of 15 June 1990) and ELINCS ("European List of Notified Chemical Substances"), whose most recent version was published in Official Journal No C 361 of 17 December 1994. These publications mainly contain the information necessary to describe a chemical substance in an unequivocal manner, i.e. a chemical name, a CAS number and an EINECS number.

These lists also include substances of unknown structure, of variable composition or of biological origin (so-called UVCB substances). This is why the inventory of fragrance ingredients was compiled on the basis of the EINECS system. The other identifiers mentioned in Directive 93/35/EEC cannot be applied (CTFA name, European Pharmacopoeia name, names recognised by the World Health Organisation, Colour Index number). The IUPAC identifier is covered by the EINECS identifier.

When substances have not been included in the EINECS system, only the CAS number and CAS name have been indicated.

3. Function of fragrance ingredients

The function of all ingredients included in this inventory is to perfume. Certain ingredients however may have several functions.

Substances used in fragrances for their properties in mixtures (solvents, excipients, etc.) are also included in the list. According to the Directive, these substances may be considered as part of the fragrance and do not have to be declared as a cosmetic ingredient, provided they are not used in excess of the recommended levels (Article 6(1)(g) of the Cosmetic products Directive).

4. Restrictions applicable to fragrance ingredients

Restrictions on the use of a given ingredient are identified wherever relevant. These restrictions are set out in the Directive itself or in the IFRA (International Fragrance Association) Code of Practice. These restrictions may take the form of a quantitative limitation (expressed as a percentage of the final product or as a concentration for application to the skin), or the ingredient may have to meet certain specifications or may only be used in conjunction with certain specified ingredients.

These substances are marked in the list with one asterisk (IFRA restrictions) or two asterisks (restrictions in the Cosmetic products Directive).

5. The fragrance inventory as a representative list

It should be noted that in this inventory the various qualities of a given ingredient, such as geraniol, have not been recorded separately; the same applies to different qualities of natural products with the same botanical origin. Orange oils from Brazil, Florida, California, etc., concentrated or otherwise, are all indicated under a single entry, i.e. "sweet orange extractives", CAS 8028-48-6, EINECS 232-433-8. This rubric is defined as follows: "Extractives and their physically modified derivatives such as tinctures, concretes, absolutes, essential oils, oleoresins, terpenes, terpene-free fractions, distillates, residues, etc. obtained from *Citrus sinensis*, Rutaceae".

Neither does the inventory include ingredients whose chemical identity is secret and constitutes the intellectual property of a fragrances manufacturer. These substances are not sold as such but used exclusively in fragrance compositions, generally at low concentrations to give them a certain characteristic and/or exclusiveness.

Name: Balsams, copaiba. Extractives and their physically modified derivatives. It consists primarily of resins, essential oils, and usually cinnamic and benzoic acids. (Copaifera, Leguminosae).

EINECS/ELINCS No: 232-289-6
CAS Number: 8001-69-2
Name: Cod - liver oil. Extractives and their physically modified derivatives. It consists primarily of the glycerides of C14 - C18 and C16 - C22 unsatd. fatty acids. (Gadus callarias, Gadidae).

EINECS/ELINCS No: 232-293-8
CAS Number: 8001-79-4
Name: Castor oil. Extractives and their physically modified derivatives. It consists primarily of the glycerides of the fatty acid ricinoleic. (Ricinus communis, Euphorbiaceae). and C16 - C22 unsatd. fatty acids. (Physeter).

EINECS/ELINCS No: 232-350-7
CAS Number: 8006-64-2
Name: Turpentine, oil * Any of the volatile predominately terpenic fractions or distillates resulting from the solvent extraction of, gum collection from, or pulping of softwoods. Composed primarily of the C₁₀H₁₆ terpene hydrocarbons: a - pinene, b - pinene, limonene, 3 - carene, camphene. May contain other acyclic, monocyclic, or bicyclic terpenes, oxygenated terpenes, and anethole. Exact composition varies with refining methods and the age, location, and species of the softwood source.

EINECS/ELINCS No: 232-352-8
CAS Number: 8007-00-9
Name: Balsams, Peru. * Extractives and their physically modified derivatives such as tinctures, concretes, absolutes, essential oils, oleoresins, terpenes, terpene - free fractions, distillates, residues, etc., obtained from Myroxylon balsamum pereirae, Leguminosae.

EINECS/ELINCS No: 232-357-5

NOMENCLATURE CONVENTIONS

The conventions used for establishing INCI names are as follows:

1. In order to facilitate use and clarity, INCI names have been designed to require a minimum of punctuation and capitalisation.
2. Wherever new nomenclature has been adopted, every effort has been made to use the shortest name consistent with these rules.
3. Simple chemical names are used wherever possible.
4. Recognised chemical abbreviations are used where applicable. A list of the abbreviations used in the Inventory may be found in Annex A.
5. Traditional stems are retained as combining forms when consistent with other systems.
6. Abbreviations are utilised for simplifying the nomenclature of families of complex ingredients when applicable.
7. Compounds that are related or are similar to materials described in recognised sources are named, whenever possible, by analogy to the listed names.
8. Singly substituted derivatives do not usually include the prefix "mono". This term is used only when required to prevent ambiguity. The absence of a suitable prefix implies "mono", e.g. Glyceryl Stearate.
9. The term "Glyceride" has been utilised to describe a monoglyceride. Mixtures of mono-, di- and triglycerides are referred to as "Glycerides". Triglycerides are assigned specific nomenclature, e.g. Tristearin.
10. Multiple substitution is routinely described with the appropriate prefix, such as "di-", "tri-" or "tetra-", e.g. Glyceryl Distearate.
11. Names of ingredients, other than colours, that contain terminal numbers are generally hyphenated. Derivatives of hyphenated materials retain the original hyphen.
12. Hydration states are not usually expressed.
13. Straight-chain alkyl groups are described by their common stem names.
14. Materials containing mixtures of even-carbon chain length fractions are named by the appropriate, commonly used fatty stem term. Materials containing

mixtures of even- and odd-carbon chain length fractions are designated by alternate nomenclature.

15. Branched-chain alkyl groups are usually described by the prefix "iso" followed by the common stem name for the comparable straight-chain group (e.g. Isostearyl Alcohol, Isocetyl Alcohol). The major exception to this rule is the nomenclature for the Guerbet alcohols. These materials are named chemically (e.g. Octyldodecanol, Decyltetradecanol) except for "2-Ethylhexyl". "2-Ethylhexyl is represented by the term "octyl" due to its widespread usage (e.g. Dioctyl Sodium Sulfosuccinate, Octyl Myristate). Therefore esters or other derivatives of 2-Ethylhexylhexanoic Acid are also named as Octanoic Acid derivatives (e.g. Iso-decyl Octanoate). Straight-chain eight-carbon groups are usually named with the appropriate stem derived from caprylic acid. (See also rules 16 and 17).
16. The following table has been included to clarify the nomenclature for derivatives of caproic, caprylic and capric acids.

<u>Chain length</u>	<u>Stem name</u>	<u>Acid</u>	<u>Ester</u>
C6	Capro	Caproic	Caproate
C8	Capryl	Caprylic	Caprylate
C10	Capr	Capric	Caprate

<u>Chain length</u>	<u>Acyl</u>	<u>Alkyl</u>	<u>Ampho</u>
C6	Caprooyl	Caproyl	Caproo
C8	Capryloyl	Caprylyl	Caprylo
C10	Caproyl	Capryl	Capro

17. The following table describes the nomenclature applied to straight-chain acids and alcohols. Branched-chain acids and alcohols utilise the names listed in this table preceded by the term "iso" (e.g. Isostearic Acid). Guerbet alcohols, however, are designated by specific names (e.g. Octyldodecanol). (See also Rule 15).

Saturated:

	<u>Acid</u>	<u>Alcohol</u>
C6	Caproic	Hexyl
C7	Heptanoic	Heptyl
C8	Caprylic	Caprylyl
C9	Pelargonic	Nonyl
C10	Capric	Decyl
C11	Undecanoic	Undecyl
C12	Lauric	Lauryl
C13	Tridecanoic	Tridecyl
C14	Myristic	Myristil
C15	Pentadecanoic	Pentadecyl
C16	Palmitic	Cetyl
C17	Margaric	Heptadecyl
C18	Stearic	Stearyl
C20	Arachidic	Arachidyl
C22	Behenic	Behenyl

Unsaturated:

C11	Undecylenic	Undecylenyl
C16	Palmitoleic	Palmitoleyl
C18	Oleic	Oleyl
C18	Linoleic	Linoleyl
C18	Linolenic	Linolenyl
C20	Arachidonic	Arachidonyl
C22	Cetoleic	Cetoleyl
C22	Erucic	Erucyl

18. The nomenclature for ingredients consisting of mixtures of similar materials (e.g. fatty acids, fatty alcohols) is determined on the basis of the chemical identity of the raw material as purchased. Mixtures that reflect the original distribution of components due to their natural source (e.g. coconut) are named utilising the source stem (e.g. coconut alcohol). If the original natural distribution has been significantly cut or enriched, the mixture is named on the basis of the predominant component.
19. Names of lanolin derivatives usually contain the stem "lan."
20. Alkanolamides are named by the specific alkyl amide stem and the appropriate abbreviation, e.g. "MEA", "DEA", owing to the widespread use of these denominations.
21. The dimethyl term is omitted and is assumed in all alkyl dimethyl amine oxide names (e.g. Stearamine Oxide). Tertiary amine oxides with different substituent groups are named completely (e.g. Dihydroxyethyl Stearamine Oxide).
22. Quaternary ammonium salts usually have the suffix "-ium" in the stem of the cation.

The term "monium" describes a monomethyl-substituted quaternary nitrogen; "dimonium" describes a dimethyl-substituted quaternary nitrogen; "trimonium" describes a trimethyl-substituted quaternary nitrogen.

23. The terms quaternium/polyquaternium are used to describe complex quaternary ammonium salts that do not have a common name or that cannot be named by analogy to established names (e.g. Quaternium-82, Polyquaternium-20).
24. The term "ampho" has been used as a combining term in the nomenclature for the imidazoline-type amphoteric surfactants. In naming these compounds, this stem is combined with the appropriate stem names for the substituent groupings (e.g. Sodium Cocoamphoacetate).
25. Common fatty stem terms are used to designate the alkyl portion of alkyl imidazoline compounds (e.g. Lauryl Hydroxyethyl Imidazoline) even though one carbon atom of the fatty radical becomes a member of the heterocyclic ring during the materials' manufacture.
26. Biological materials are named by specific terms (e.g. Hyaluronic Acid) when the material has been isolated, purified and chemically characterised. Alternate nomenclature for biologicals (e.g. Glycosamino-glycans or Spleen Extract) is utilised to name materials in accordance with the extent of their processing.
27. Cosmetic colorants have INCI names according to the nomenclature used in Annex IV of the Cosmetics Directive 76/768/EEC.
28. Hair dye ingredients are named according to chemical structure. In the event that chemical names are very complex, a colour/number combination is used prefixed by the letters "HC".
29. Denatured alcohols are designated by the INCI name "Alcohol Denat.". Alcohol Denat is ethyl alcohol that is denatured with one or more denaturing agents in accordance with the national legislation of each EU Member State.
30. Materials derived from plants are known as botanicals. They have INCI names based on the international LINNÉ designated nomenclature of the genus and the species. Chemical derivatives of botanicals follow the nomenclature rules for chemicals.
31. Name/number combinations are used as INCI names for cosmetic ingredients only where the complexity and/or similarity of ingredients precludes assignment of reasonable nomenclature by any other means. In all cases where arbitrary numbers are used, these numbers are preceded by names suggestive of the structure or the composition of the material. Each name/number combination represents a specific ingredient that is listed in the Inventory. The following name/number series of combinations have been used:
 - a. Benzophenone
This term is used for all benzophenone derivatives (e.g. Benzophenone-2).
 - b. HC Colour

See Rule 28.

- c. Quaternium/Polyquaternium
See Rule 23.
 - d. Hydrofluorocarbon/Hydrochlorofluorocarbon
These terms are used for hydrohalocarbon aerosol propellants (e.g. Hydrofluorocarbon 152a, Hydrochlorofluorocarbon 142b).
 - e. Polysilicone
This term is used to describe complex silicone polymers that cannot be named by common names or established conventions for silicone compounds (e.g. Polysilicone-1).
32. Compounded mixtures created by combining several materials are named by listing each ingredient present in descending order of predominance.
33. The INCI names for extracts represent the "material extracted" and do not include reference to the extracting solvents and/or other diluents that may be present in these materials.
34. Solvents and/or diluents contained in commercially available raw materials such as surfactants, polymers and resins are not normally identified as part of the INCI name.
35. Alkoxylated materials are named by including the alkoxylation level as the average number of moles of ethylene oxide and/or propylene oxide.

Ethoxylates, which are commonly expressed by an approximate molecular weight, are converted to the number of moles using the following table:

Approximate Molecular Weight	Average Number of Moles
100	2
200	4
300	6
400	8
450	9
500	10
600	12
1000	20
1540	32
1800	36
2000	40
3000	60
4000	75
6000	150
8000	180

Numerical designations included in alternate chemical names for ethoxylated compounds describe the average number of moles of ethoxylation when stated parenthetically, e.g. Polyethylene Glycol (20000).

Without parenthetical notation, the numerical value identifies molecular weight, e.g. Polyethylene Glycol 20000.

36. Ethoxylated alcohols are named by completing the conventional alcoholic stem name with "eth" followed by the average number of moles of ethylene oxide.
37. The polyethylene glycol fraction of all other ethoxylated compounds that are not named by Rules 6 or 36 is followed by the average number of moles of ethylene oxide.
38. The term "Pareth" applies to ethoxylated paraffinic alcohols containing both even- and odd-carbon chain length fractions.
39. The term "Acrylates" is used to describe linear, non-crosslinked copolymers that contain combinations of acrylic acid, methacrylic acid and their simple esters. Similarly, the term "Crotonate(s)" is used to describe the copolymers that contain combinations of crotonic acid and its simple esters.
40. The name "Carbomer" is used to describe high molecular weight crosslinked homopolymers of acrylic acid. The crosslinking agent(s) are identified in the ingredient monograph definition. (See also Rule 41).
41. The term "crosspolymer" is used to describe polymers other than Carbomer that are crosslinked. (See also Rule 40).

ANNEX A

ABBREVIATIONS

The following abbreviations are used alone or as combining forms for the naming of cosmetic ingredients in the Inventory:

AMP	Aminomethyl Propanol
AMPD	Aminomethyl Propanediol
BHA	Butylated Hydroxyanisole
BHT	Butylated Hydroxytoluene
CHDM	Cyclohexanedimethanol
CI	Colour Index
DEA	Diethanolamine
DEDM	Diethylol Dimethyl
DIBA	Dihydroxyisobutylamine
DIPA	Diisopropanolamine
DMAPA	Dimethyl Aminopropylamine
DMDM	Dimethylol Dimethyl
DMHF	Dimethyl Hydantoin Formaldehyde Resin
DNA	Deoxyribonucleic Acid
DVB	Divinylbenzene
EDTA	Ethylenediamine Tetraacetic Acid
EDTHP	Ethylenediamine Tetrahydroxy Propylene
GLY	Glycine
HC	Hair Colour
HCl	Hydrochloride
HEDTA	Hydroxyethyl Ethylenediamine Triacetic Acid
MA	Maleic Anhydride
MDM	Monomethylol Dimethyl
MEA	Monoethanolamine
MEK	Methyl Ethyl Ketone
MIBK	Methyl Isobutyl Ketone
MIPA	Monoisopropanolamine
NTA	Nitrilotriacetic Acid
PABA	p-Aminobenzoic Acid

PCA	Pyrrolidone Carboxylic Acid
PEG	Polyethylene Glycol
PEI	Polyethylenimine
PG	Propylene Glycol
PPG	Polypropylene Glycol
PTFE	Polytetrafluoroethylene
PVM/MA	Polyvinyl Methyl Ether/Maleic Anhydride
PVP	Polyvinylpyrrolidone
RNA	Ribonucleic Acid
SE	Self-Emulsifying
SIP	Sulfoisophthalate
SMDI	Saturated Methylene Diphenyldiisothionate
TDI	Toluene Diisocyanate
TEA	Triethanolamine
TIPA	Triisopropanolamine
VA	Vinyl Acetate
