CEE: VI/22

DOCUMENT 1981/82 - 1982/83

This document has been prepared for use within the Commission. It does not necessarily represent the Commission's official position.

PREFACE

The booklet presenting the results of the Community's Farm Accountancy Data Network for 1978/79 - 1981/82, published in 1984, was well received.

This has led us to pursue our efforts to give the relevant interest groups, authorities and individuals easier access to a summary of FADN data and results, and so promote more widespread knowledge, study and use of them in the context of Community agriculture.

This new booklet covers the 1981/82 and 1982/83 accounting years.

It is basically similar to its predecessor but has been expanded to include regional data.

Guy LEGRAS
Director General for Agriculture

CONTENTS

1. About the Farm Accountancy Data Network
 - 1.1 Aims of the booklet
 - 1.2 Comments on the Farm Accountancy Data Network

2. Principal farm results according to to the Community classification scheme
 - 2.1 Results according to principal type of farming
 - 2.2 Results according to farm size class

3. Results according to utilized agricultural area and income
 - 3.1 Results according to utilized agricultural area
 - 3.2 Results according to income

4. Results according to region
 - 4.1 Regional income trends
 - 4.2 Inter-regional disparities in farm incomes

5. Income distribution 1982/83

6. Explanatory notes

1. About the Farm Accountancy Data Network

1.1 Aims of the booklet

As a follow-up to the publication of the farm accounts results for the 1978/79 - 1981/82 accounting years (1), this booklet seeks to give an overall picture of farm incomes in the 1982/83 accounting year. The results for the 1981/82 accounting year, which are now available in final form, have also been included.

The basic layout is the same as before, but a new accounting year has been included. In the tables giving results according to type of farming, a few additional farm types are shown which were not included last year.

The main new feature is that this year farm results are given for the first time at regional level. The Commission is thus responding to the need, often expressed, for a detailed account of regional variations in farm incomes in the Community. The figures will give users a comprehensive and up-to-date view of the structure and viability of agricultural holdings in all parts of the Community.

The farm results were compiled on the basis of data available as at 15 May 1985, which means that final results for several Member States, and Community averages, could not be calculated for the 1982/83 accounting year.

1.2 Comments on the FADN

Field of survey

The FADN does not cover all agricultural holdings in the Community. Selection was originally limited to holdings on which the day-to-day management was in the hands of a single farmer or manager, which had a labour input equivalent to at least 1 Annual Work Unit (AWU) (1), and whose main activity was agricultural production for sale. The FADN sample was thus restricted to commercially-operated "main-income" holdings with a significant level of output. These represent the most important target for agricultural policy measures.

However, since the 1982/83 accounting year, selection thresholds have been based on the economic size of holdings, using European Size Units (ESU) (2). This has meant that more and more part-time holdings are being included in the sample than when selection thresholds were based on AWU.

Table 1 shows the FADN field of survey according to the old selection thresholds. These indicate the coverage (%) of the total number, utilized agricultural area (UAA) and total standard gross margin (SGM) of holdings in the Community. About 62% of all holdings in the Community were covered. But the percentages in terms of total UAA and SGMS - the latter can be taken as a

-
- (1) For Italy, the Netherlands, Denmark and Ireland, the selection threshold was 0.75 AWU.
 - (2) The selection thresholds vary according to the size structure of holdings in the country concerned: the threshold is 1 ESU in Italy and Greece and 6 ESU in Belgium and the Netherlands.

yardstick of agricultural production - were substantially higher in 1980, averaging 83% for the Community. Altogether the FADN field of survey covers about 3 000 000 agricultural holdings, two-thirds of the total number of persons engaged in agriculture and 90% of milk production.

(1) 1975 Farm Structure Survey; for Greece, holdings over 1 ha of UAA.

FADN sample

Table 1 also shows the increasing number of holdings in the FADN sample. In the 1982/83 accounting year, a record number of about 35 000 was reached, corresponding to an average sampling fraction of 1.2% of the FADN field of survey.

Important factors for the classification of agricultural holdings are the type of farming (TF) and size class expressed in European Size Units (ESU). The farm results in section 2 are broken down according to these two classification criteria. For the accounting year 1982/83 a breakdown of sampled holdings by general type of farming is shown in Table 2.

Of the 35 442 returning holdings analysed at 15 May 1985, by far the largest number for the accounting year 1982/83 were classed as TF 4 (Grazing livestock) followed by TF 1 (Field crops), TF 8 (Crops - livestock, mixed) and TF 3 (Permanent crops). The relative importance of the different types of farming naturally varies from one Member State to another and the diversified structure of Community agricultural production is clearly apparent (see also Table 6 in section 6, Explanatory Notes).

All the holdings in the sample shown in Table 2 are weighted by the "free" weighting procedure on the basis of the 1975 Community Structure Survey. Each holding and each of its results is assigned a specific weighting factor. The sum of the weighting factors is equal to the number of holdings represented by the FADN sample.

Income concepts

To assess the situation in terms of income of the agricultural holdings represented by the FADN, the income indicators Farm Net Value Added, Farm Net Value Added/AWU and, in some presentations, also Family Farm Income are used. Of the many different income indicators, Farm Net Value Added/AWU is of special significance because not only can it be worked out for all the Member States but

it is also broadly comparable with the concept of Net Value Added at factor cost used for the Sectoral Income Accounts. For the purposes of this booklet it is the main income indicator. For further definitions, see Explanatory Notes on page 65 onwards.

Farm Net Value Added is the gross income remunerating labour, capital and land used. Wages, rent and interest payments are not deducted from Farm Net Value Added and are only deducted when calculating Family Farm Income. Both income concepts, however, relate exclusively to earnings derived from agricultural activity. All other items entering in the total income of the farmer and his family, e.g. earnings from other work unrelated to agriculture, pensions, investment income etc., lie outside the scope of the FADN.

2. Principal farm results according to the Community classification scheme

The Community classification scheme is based on type of farming and size of holding (1). Each holding in the FADN sample is classified by type of farming and size class on the basis of the Community "typology".

The following tables show the national farm results for 15 principal types of farming and for five size classes.

For the 1982/83 accounting year, positive income trends were observed in all the Member States. This is to a large extent due to the year-on-year increase in output of the main agricultural products such as milk, cereals, wine and oilseeds, coupled with rising producer prices. On the beef/veal and pigmeat markets, however, the trend was less positive, with the volume of production decreasing, though prices increased. Both these trends are reflected in the results for the types of farming. These should be looked at with reference to Table 6, which shows the relative importance of the different types of farming.

(1) see Decision 78/463/EEC or "FADN Farm Accounts Results 1978/79 - 1981/82", Luxembourg 1984.

2.1 Results according to principal type of farming

In terms of the indicator Farm Net Value Added per Annual Work Unit, average incomes in the Community for 1982/83 showed a marked increase, from 7 500 ECU for the previous year to 8 800 ECU (+17%). Results were particularly good in Luxembourg (+37%) and Germany (+28%), whereas increases for Ireland and the Netherlands (+4% and +3% respectively) were below average.

Positive income trends were also observed for the individual types of farming which, with the exception of "Horticulture" (TF 21), showed far better results for the Community as a whole than in the 1981/82 accounting year. Increases in income were particularly significant in TF 31 "Vineyards" (+36%) as well as in TF 71 "Partially dominant grazing livestock" (+28%) and TF 81 "Field crops and grazing livestock" (+26%). The large category of "Specialist dairying" (TF 41) was also well above the Community average, with an increase in income of 22%; only holdings in TF 12 "Field crops, other", TF 51 "Pigs", TF 42 "Cattle rearing/fattening" and TF 44 "Grazing livestock, other" showed below-average increases.

Income levels in the Community varied between 6 000 ECU for holdings in types 32 and 62 "Fruit/permanent crops, other" and "Mixed cropping", and 18 200 ECU for holdings in type 51 "Pigs". Above-average income levels continued to be attained by holdings in "Cereals" (TF 11), "Horticulture" (TF 21), "Vineyards" (TF 31), "Specialist dairying" (TF 41) and "Mixed livestock, other" (TF 72). Well below average results, on the other hand, were attained by holdings in TF 42 "Cattle rearing/fattening", TF 44 "Grazing livestock, other" and TF 71 "Partially dominant grazing livestock".

2.2 Results according to size class

The definition of size classes is based on the criterion Economic Size Unit, equal to 1000 EUA of standard gross margin. Holdings of less than 4 ESU are included in the results for Italy, Ireland, Greece and Northern Ireland, where this farm size class is more important than in other regions. However, in order to make a comparison of similar groups, results are also presented for all holdings over 4 ESU. Definitions of the income indicators used are given in section 6.

The positive trend of Farm Net Value Added per Annual Work Unit for the 1982/83 accounting year is also apparent in the various size classes. An increase of 17% on the previous year was obtained on average throughout the Community for all agricultural holdings. This was principally accounted for by the holdings in the size class <4 ESU, which attained an above-average increase of 18%. Comparing badly with this are the holdings in size class >40 ESU, with an increase of only 9%. The increase for all holdings >4 ESU averaged only 14%, which is due to the relatively poorer performance of the larger holdings compared with the smaller ones.

Downward income movements were observed in only two size classes in Greece and three size classes in Ireland. For all the other Member States and size classes the changes were positive, and substantially so in some cases. The relatively good average overall results for Luxembourg and Germany are reflected in improvements in the separate size classes, whilst the below-average increases in the overall results for the Netherlands and Ireland rule out any substantial change in the aggregate figures for the individual size classes.

There are, predictably, marked differences between the absolute income levels of the individual size classes. This is due to the fact that holdings are classified according to their standard gross margin, and hence according to economic output. For the Community as a whole, the average Farm Net Value Added/AWU in the smallest size class was 3 400 ECU (2 900 ECU for the 1981/82 accounting year) and in size class >40 ESU it was 21 100 ECU (19 300 ECU for 1981/82). Although the relative gap between the two groups narrowed somewhat in 1982/83 compared with the previous year, the absolute difference increased from 16 400 to 17 700 ECU. Hence the trend observed in previous accounting years continued in 1982/83.

3. Results according to utilized agricultural area and income

As well as being classified by type of farming and size class (section 2), the results are also classified by utilized agricultural area and income. In the presentation according to income, several new indicators have been included, showing additional information.

3.1 Results according to utilized agricultural area

These results classify holdings on the basis of hectares utilized agricultural area. The following points should be noted in connection with these figures:

- for Luxembourg in 1981/82 the balance of interest paid (after deduction of subsidies) is negative, as interest subsidies in excess of the interest paid were made during this accounting year.
- for the United Kingdom and Italy, the item interest paid was not available for all holdings, so Family Farm Income could not be calculated.

As in the other tables, the breakdown of results by UAA shows a positive trend in Farm Net Value Added/AWU for the great majority of categories. At Community level, the increases were fairly close to the average, between + 11% and + 23%. Only the 15-20 ha category showed an increase that was well above average; income increases in the other categories of holding were near-average.

Comparison of the holdings in the group 0-2 ha UAA with other categories shows that the classification by UAA is not necessarily an indication of productive capacity. For 1982/83, incomes in the 0-2 ha group were equivalent to 73% of the EEC average Farm Net Value Added/AWU, whereas the income levels of holdings in the two categories immediately above were only 50% and 63% of the EEC average, respectively. This is because holdings in the 0-2 ha group include specialized horticulture and permanent crops which, especially in France, earn above-average incomes.

The lowest absolute income level was recorded, as in 1981/82, in the 2-5 ha category, which represents almost 18% of all FADN holdings but attained only 50% of the EEC average income.

SOURCE: FADN (WEIGHTED ON THE BASIS OF THE 1975 FARM STRUCTURE SURVEY)
 NB: FOR DEUTSCHLAND, FRANCE, BELGIE/BELGIQUE, LUXEMBOURG, NEDERLAND, THE UNITED KINGDOM (EXCEPT NORTHERN IRELAND), AND DENMARK THE RESULTS DO NOT INCLUDE FARMS OF LESS THAN 4 ESU;
 GROUPS OF FARMS WITH LESS THAN 10 HOLDINGS ARE NOT LISTED; MONEY VALUES ARE ROUNDED TO 10 ECU, WHICH CAN LEAD TO MINOR ROUNDING DISCREPANCIES.
 THE RESULTS 1982/83 FOR ITALY, LUXEMBOURG, HELLAS AND EUR10 ARE PROVISIONAL

3.2 Results according to income

In this breakdown holdings are grouped on the basis of Farm Net Value Added per holding. The following points should be noted:

- for Luxembourg in 1981/82 the balance of interest paid (after deduction of subsidies) is negative, as interest subsidies in excess of the interest paid were made during this accounting year.
- for the United Kingdom and Italy, the item interest paid was not available for all holdings, so Family Farm Income could not be calculated.

The average figures for the Community show that, compared with the previous year in particular, the number of holdings in the income categories between 0 and 10 000 ECU of Farm Net Value Added is well down. In percentage terms these six income classes accounted for 60% of the total number of holdings in the FADN population in the 1981/82 accounting year but only 52% in 1982/83; the number of holdings in the groups with higher Farm Net Value Added has risen correspondingly. This is not surprising, as the results are presented on the basis of pre-fixed limits for Farm Net Value Added per holding, but it underlines once again the positive general trend of farm incomes in 1982/83. Thus, in comparison with the previous year, the figures show only small changes in the various income classes for all the variables considered, and in particular for Farm Net Value Added per holding, Farm Net Value Added/AWU and Family Farm Income.

The percentage of holdings in the group with a negative Farm Net Value Added fell from 4.5 to 3%. However, it is noticeable that this group enjoys relatively high factor endowment in terms of structural variables such as area, livestock units and operating capital. At the same time there is a close relationship between "total output" and "supplies and services", which are all fairly high in absolute terms. This situation, combined with heavy depreciation - the third heaviest in all ten groups - and substantial interest payments, gives rise to negative incomes in this group. It seems to be a group of holdings in which the input/output ratio is very high as a result of various economic setbacks, and so no profits were made.

4. Results according to region

4.1 Regional income trends

Although, on the whole, farm incomes rose in 1982/83, some differences were observed between the main branches of agriculture, and this also affected income trends from one region to another.

For example, in regions where a high percentage of agricultural income is derived from cereals, the trend was upward, as in the Paris basin, northern Germany and the Po valley. On the other hand, in regions where the emphasis is more on beef/veal or fruit production, incomes showed little or no improvement, as in Franche-Comté, Auvergne, Limousin, Ireland, Scotland, Wales, Apulia, Abruzzi, Molise and Campania.

The figures for increases in farm incomes in the United Kingdom and Italy seem to be lower than would otherwise have been the case, because of fluctuations in national currencies against the ECU.

4.2 Inter-regional disparities in farm incomes

Broadly speaking, the FADN accountancy data confirm the conclusions reached in other studies made by the Commission as regards regional disparities. The map (p. 54) shows that the highest farm incomes per person are earned in England, Scotland, Denmark, the Netherlands, Belgium and the Paris basin. The lowest are in Italy and Greece.

Incomes in Emilia-Romagna, Sardinia, Rheinland-Pfalz, Franche-Comté and Aquitaine coincide with the Community average. Incomes in Luxembourg, Alsace, Lorraine, western and south-eastern France, northern Germany, the Po valley and Wales are slightly higher; incomes in southern and central Germany, Ireland, south-western France and several regions of Italy are below the Community average.

Inter-regional disparities in farm incomes

100 = Community average Farm Net Value Added/AWU

source : FADN results, 1982/83 (weighted on the basis of the 1975 Farm Structure Survey)

(1) This Member State constitutes one FADN "region"

There is a 1 to 8 ratio between the results for the regions with the lowest incomes (Molise and Valle d'Aosta) and those with the highest (the Paris basis), i.e. a considerable regional variation in average incomes.

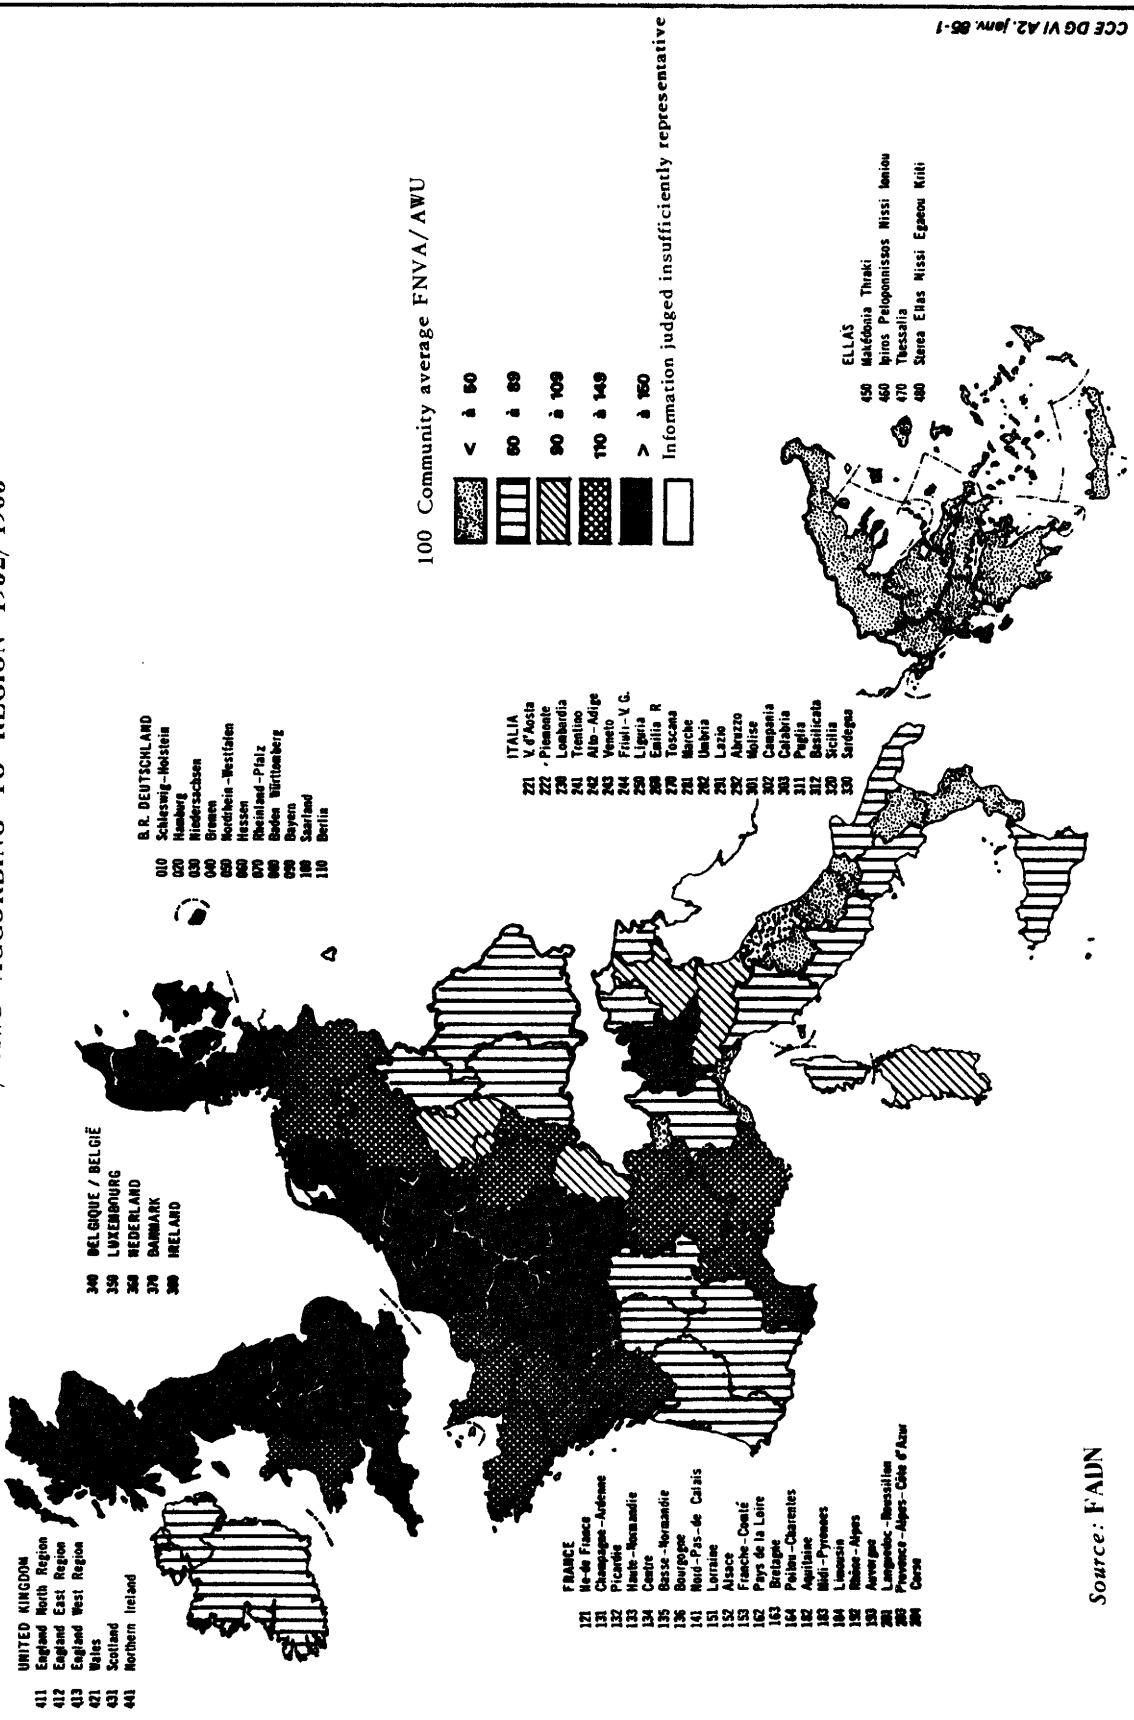

Although the variation is wide, it is also complex and it would be unrealistic to attribute it solely to natural causes, i.e. soil and climate. The causal factors include important

structural differences, resulting from variations in type of farming, the economic size of holdings, the proportion of specialized holdings, the degree of mechanization and depreciation. But connected with these are other factors, such as market outlets, the existence of technical and economic advisory services, training facilities and the socio-economic environment (e.g. lack of alternative employment), etc.

The following should be noted with regard to the regional tables:

- the "Stadtstaats" Hamburg, Bremen and Berlin are combined into a single region, for which accounting data is available only from 1982/83;
- 1981/82 accounting data for Hessen are neither harmonized nor comparable with other accounting years;
- 1982/83 accounting data for Alto Adige have not yet been received by the Commission services;
- for the United Kingdom and Italy, the item interest paid was not available for all holdings, so Family Farm Income could not be calculated for most regions.

5. Distribution of Incomes 1982/83

By distribution of incomes in agriculture is meant the division of the total persons working in agriculture according to income class.

Table 3 and the Graph show the distribution of incomes per person for the Community and for member states. In all cases this is the income arising from agriculture only, for persons (both employees and self-employed) working on so-called professional farms. Although absolute incomes fluctuate considerably from year to year and only a single year's results are shown, the relative position of the different countries and income groups is fairly stable.

The most striking phenomenon in the Graph is the difference between the northern and southern countries of the Community. In Greece over 60%, and in Italy almost 50% of persons earned less than 4 000 ECU from farming, but in the Netherlands, Belgium, Denmark and the United Kingdom farms having an income per person of less than 4 000 ECU ranged from only 3-11% of the total.

This situation is mirrored at the top end of the income scale, with persons earning 20 000 ECU or more comprising 71% of the total in the Netherlands, 63% in Belgium, 67% in Denmark and 54% in the United Kingdom, as against about 8% in Italy and only 1% in Greece.

In Germany, France, Luxembourg and Ireland incomes are concentrated in the 4 - 12 000 ECU range. This includes at least 40% of persons in agriculture in each of these countries, and in the Community as a whole.

6. Explanatory notes

For the 1982/83 accounting year the FADN processed accountancy data from 35 442 agricultural holdings. These holdings represent 62% of agricultural holdings and 83% of agricultural output in the Community (EUR 9).

The accounting year starts between 1 January and 1 July, depending on the Member State. The figures for 1982/83 relate to a 12-month period between 1 January 1982 and 30 June 1983. All the results presented in this booklet are based on data available at 15 May 1985.

Classification. The farm types selected correspond to the 17 principal types of farming in the Community classification (typology). Types are divided into specialist and mixed.

Number of holdings represented. Holdings are selected in each region according to particular type of farming and economic size class. For this purpose the FADN field of survey is divided into cells at the lowest level of aggregation of type, size class and region. The number of holdings represented is the sum of all holdings in all cells in the field of survey from which holdings are sampled. Some cells may have no holdings sampled, either because very high selection rates would be necessary or because there are technical difficulties in selecting holdings.

FADN coverage. The FADN field of survey, as defined by the selection criteria for the FADN (see point 1.2), shown as a percentage of the total population of holdings in the 1975 Community Farm Structure Survey.

UAA - utilized agricultural area

European size unit (ESU). 1 ESU is equivalent to 1000 EUA of standard gross margin at 1972-74 conditions and prices. It is a representation of the economic size of the farm business, generally preferred to an area measure as it takes into account the different intensities of agricultural enterprises.

Annual work unit (AWU). This represents the actual agricultural work done by one full-time worker in one year. Part-time and seasonal work are attributed fractions of an AWU.

Family labour unit (FLU). This represents the actual agricultural work done by one full-time farmer or family worker in one year (precisely, any person in agricultural work not receiving a wage or salary).

Operating capital. The value of machinery and equipment (deadstock), livestock and circulating capital, but excluding land and buildings.

Total capital. The value of the total capital available to the holding: land, buildings, stock, machines, equipment and circulating capital.

Total output. This is equal to the value of total production during the accounting year. It covers products sold, farmhouse consumption, benefits in kind and farm use and includes changes in the value of livestock and stocks of crop products.

Supplies and services. All inputs, including home-grown feed and seed, machinery and building maintenance costs, but excluding depreciation, wages and rent.

Home-grown feed and seed. These are inputs produced and used on the farm and are included in supplies and services.

Gross farm income. Total output less supplies and services. Grants, subsidies and taxes directly related to production, and the VAT balance are included.

Depreciation. Provision for depreciation of machinery and buildings owned by the holder, calculated on the basis of replacement cost.

Land taxes and insurance. Taxes levied on land and buildings, and cost of insuring farm buildings. The VAT balance and taxes on production are not included.

Farm net value added (FNVA). Gross farm income after deduction of depreciation, land taxes and insurance.

Rent. Rent paid.

Wages and social security. Expenditure of wages and salaries including social security costs for paid labour.

Interest paid. Interest charges on loans obtained for farm purposes, after deduction of any interest subsidy.

Investment subsidies. Subsidies and premiums received on investments made.

Family farm income. The income available to the farmer and his/her family, calculated as Farm Net Value Added less wages and social security, rent and interest paid, plus investment subsidies. Not yet available for all farms in the United Kingdom and Italy.

RESUME

This booklet presents the main accounts results of the 35.000 or so holdings taking part in the European Community's Farm Accountancy Data Network. Aggregated results for the 1981/82 and 1982/83 accounting years are given along principal type of farming, economic size class, area cultivated, income level and by region. There is also a section giving income breakdown by number of work units.

1982/83 saw incomes increase in all Member States. This development can be explained mainly by increased production of several key products (milk, cereals, wine). Holdings engaged in these areas of production were able to increase their incomes more than other types of holding. However, there are still big differences between different types of farming: specialist pig farms had the highest incomes, fruit and mixed cropping the lowest.

Relatively, it was small farms which benefitted most from the positive incomes trend in 1982/83; but in absolute terms the gap widened between their incomes and those of the big farms, continuing the trend of previous years.

Income levels varied considerably from region to region, by a ratio as marked as 1 to 8. The lowest incomes were seen in Greece and several regions of Italy.

The breakdown of agricultural income per work unit shows that in 1982/83 a third of all farm workers in the Community earned less than 4000 ECU, and only 9% earned more than 20.000 ECU. Again there were big differences between Member States.
