## I. Current market situation

### 1. Production

Production in the 10-member Community, which had stabilised at around 33-34 million tonnes, went up to about 40-42 million tonnes with the entry of Spain and Portugal.

In 1985 potato production represented 2.7% of the value of total production (EUR 10).

The European Community is theoretically self-sufficient so far as potatoes are concerned, but it regularly imports new potatoes (at the rate of about 300,000 t a year).

So far as ware potatoes are concerned trade is limited to the Community, with very occasional imports from non-member countries and then only at times of great shortage (1975-1976).

The potato acreage in 1985 was about 1,100,000 ha (EEC 10). With Spain and Portugal the utilized area will be in the order of about 1,500,000 ha.

Certain distinctions need to be made so far as the various categories of potatoes are concerned.

For plant health reasons seed potatoes are mainly grown in the North of Europe (virtually total absence of aphids and therefore seed potatoes in good condition so far as virus diseases are concerned).

Ware potatoes, i.e. those from the August-September crop and which are marketed during the winter, show lower production costs in Europe's North and Centre; the same holds good for the varieties intended for the various processing industries. New potatoes, and especially those intended for export, are grown more in the South.

For these reasons there is a two-way flow of trade: seed potatoes, ware potates and those for processing move from the North to the South, while new potatoes go from the South up to the North.

Community trade in potatoes is, therefore, very extensive. The varieties grown in the EEC number about 300.

According to the latest statistics there are 1.8 million Community producers - 601,000 in France, 530,000 in Germany, 441,000 in Italy, 63,000 in the United Kingdom, 123,000 in Ireland, 64,000 in Belgium, 97,000 in Greece, 44,000 in the Netherlands, 18,000 in Denmark and 3,200 in Luxembourg.

## 2. Trade

Total trade in potatoes in the countries of the EEC in 1986 represents 8.7% of Community production. Trade in seed potatoes and new potatoes respectively during that year represented around 12% and 13% of the production of these two crops.

Although intra-Community trade (about 3.5 million tonnes) is very important, trade with non-member countries is on a smaller scale (800/900,000 t).

Bearing in mind the type of production favoured in each Community country, it is interesting to look at the economic importance of the potato sector in each of them.

The Netherlands remains the EEC's principal exporting country. In 1986 its exports totalled 1,842,137 t, of which 1,264,988 t were ware potatoes and potatoes intended for the processing industry, while 503,131 t were seed potatoes. So far as their end-uses were concerned, 1,478,415 t were for intra-Community trade and 337,127 t were exported. The Netherlands imports about 700,000 t of potatoes, either as new potatoes or for its processing and starch industries.

France is the EEC's second largest exporter. In 1986 it exported 533,663 t, of which about 482,000 t were ware potatoes and new potatoes and almost 53,000 t were seed potatoes.

Of these 454,214 t went for intra-Community trade, while 79,433 t were exported to non-member countries. France imports some 300,000 t of seed potatoes and new potatoes as well as other potatoes intended for processing.

The Federal Republic of Germany is the biggest importer country in the EEC. In 1986 it imported about 960,000 tonnes. This consisted of about 230,000 t of new potatoes, about 627,000 t of ware potatoes and about 52,000 t of seed potatoes.

During the same year Germany exported about 600,000 t of potatoes, destined mainly for the Dutch starch industry.

Italy, in 1986, imported 436,037 t of potatoes, of which about 78,000 t were seed potatoes and almost 356,000 t were ware potatoes. Italy exports mainly new potatoes. The 1986 figure was 250,258 t, which went mainly to Germany.

Great Britain exports seed potatoes, mainly to non-member countries, but imports new potatoes from the countries around the Mediterranean - particularly Cyprus, Egypt, Morocco, and the Canary Islands - and ware potatoes from the EEC. The quantity of seed potatoes was around 99,395 t in 1986; imports of new potatoes in the same year stood at 247,000 t.

Spain imports seed potatoes and exports new potatoes. In 1986 it imported about 28,000 t of seed and close on 100,000 t of ware potatoes (as a result of the summer drought that year). During the same year Spain exported about 68,000 t of new potatoes.

Greece imports seed potatoes and exports new potatoes. In 1986 it imported about 8,000 t of seed potatoes and exported approximately 26,000 t of new potatoes. This figure can also top 40,000 t.

Belgium and Luxembourg (BLEU) import seed potatoes and ware potatoes but export mainly ware potatoes. Total exports in 1986 were about 461,000 t and exports were around 462,463 t.

Ireland exports mainly seed potatoes. In 1986 it exported about 25,000 t of seed potatoes and some ware potatoes, but imported about 100,000 t of ware potatoes and new potatoes.

Denmark exports seed and ware potatoes and mainly imports new ones. Its exports in 1986 stood at 50,445 t and imports were in the order of 33,738 t.

Portugal mainly imports seed potatoes and its exports are very modest. In 1986 it imported about 100,000 t (57,000 as seed) and exported 3,874 t of ware and new potatoes.

### 3. New potatoes

The UN standards (Geneva) define new potatoes as "potatoes harvested before their complete maturity, marketed immediately after lifting and whose skin can be easily removed by rubbing or scraping". New potatoes are grown during the winter in the coastal areas of the Mediterranean and harvested from the end of February through till the end of June.

Community production (EUR 12) is about 3 million tonnes and has remained almost stationary around this figure since 1972. There is currently a drop in production in the countries in the North and the Centre of the Community and an increase in the southern countries, especially Italy.

To quote one example that bears this out, production in Germany has fallen by 30% from 803,000 t in 1972 to 556,000 t in 1986.

The figure for France has gone from 517,000 t in 1972 to 386,000 t in 1986, a drop of 25%.

United Kingdom production has fallen by 13%, from 465,000 t in 1972 to 403,000 t in 1985.

Italy's output, on the other hand, rose by 53% over the same period, going up from 324,000 t in 1972 to 498,000 t in 1986. Production by Greece and Spain looks like being more or less stationary at present.

The varieties grown are of the "early" type.

Those grown in Germany are Atica, Gloria, Sieglinde and Saskia.

Italy, France, Greece and Belgium grow Dutch varieties - Spunta, Sirtema, Jaerla, Ostara, and Nicola. In Italy (Apulia) they also grow the German Sieglinde variety, which is much liked by the Germans (festkochende Sorte).

The varieties grown in the United Kingdom are chiefly the white-skinned British varieties: Ulster Sceptre, Royal Kidney, Arran Comet, Pentland Javelin. In Spain they grow the French Claustar variety for Germany and, for the United Kingdom particularly, the white-skinned King Edwards. The other varieties - Jaerla, Draga, Baraka, Désirée - are grown as much for France as for the United Kingdom.

The biggest non-member producers of new potatoes are Cyprus, Egypt and Morocco.

Cyprus mainly exports the Dutch Spunta and Nicola varieties and the British Maris Piper and Arran Banner varieties. Morocco mainly exports the Dutch Nicola variety, while Egypt specialises in King Edwards (English).

The supplying of the Community market is on a phased timescale that depends on where the supplier countries are geographically located. The first imports are in fact from the North African countries (Morocco, Egypt) and from Cyprus around February-March, then in April from Sicily, Apulia and Spain, finishing with Brittany, which does not export its potatoes until the end of May.

Since new potatoes are grown over the winter, the timetable and the quantities exported can vary considerably depending on the weather.

In brief, the usual trade flows are as follows:

Italy : exports mainly to Germany and in smaller quantities to France, Belgium and the Netherlands.  
Greece : exports mainly to the United Kingdom and Germany and, in smaller quantities, to Belgium and the Netherlands.  
France : exports mainly to Germany and the United Kingdom.  
Morocco : exports mainly to France.  
Spain : exports to the United Kingdom, Germany and France.  
Cyprus : exports mainly to the United Kingdom and, in smaller quantities, to Germany and Belgium.  
Egypt : exports mainly to the United Kingdom.

#### 4. Seed potatoes

Seed potatoes must be in an excellent state of health so far as virus diseases are concerned in particular. This is why the cultivation of seed potatoes has developed in areas that offer ideal conditions for their growing season - Friesland, Groningen and the northern polders in the Netherlands, Lower Saxony and Bavaria in Germany, Scotland in the United Kingdom, and Brittany in France.

Community production swings between 2.5 and 2.8 million tonnes. The Netherlands dominates this form of production, with an area of 34,000 ha.

The other producer countries are the United Kingdom, France, Germany, Denmark and Ireland.

Intra-Community trade is around 250,000 t, but the EEC exports large quantities to non-member countries (about 500,000 t). Imports into the Community from non-member countries are very small at about 15,000 t (from Canada, Switzerland, Austria and Poland).

The leading varieties in the EEC are the Dutch ones. In fact, approximately 50% of the Community acreage down to seed potatoes is planted with Dutch varieties: Bintje, Climax, Désirée, Eesterling, Jaerla, Oewtara, Spunta, Bea, Alpha. This success can be attributed to the big demand for early varieties.

So far as the seed potato trade is concerned the situation is as follows: the Netherlands is in first place with about 550,000 tonnes, about 40,000 t of which is exported to EEC countries and just under 300,000 t to non-member countries.

The United Kingdom exports about 115,000 t, above all to non-member countries, while French exports stand at around 50,000 t, of which about 40,000 t goes to non-member countries and 10,000 t to the EEC. The other exporting countries are Germany (approx. 28,000 t), Denmark (approx. 20,000 t) and Ireland (approx. 10,000 t).

## 5. Potato industries

The potato processing industries break down as follows:

- starch extraction: approx. 4.5 million tonnes
- alcohol extraction: approx. 400,000 tonnes
- processing into foodstuffs: approx. 5 million tonnes

Potato starch is the big competitor of starch from maize and distillation produces alcohol for oral consumption. As for the other industrial uses for human consumption, the processing of potatoes only got under way in Europe in the sixties, and has continued expanding steadily ever since.

The industry gets about half its supply of raw materials from production contracts with the growers and buys the rest on the open market.

The following figures are enough to give some idea of how the sector has evolved, taking into account the fact that this industry operates mainly in the North of the Community.

In 1961/62 the EEC processed 417,000 tonnes of potatoes; the figure for the 1975/76 marketing year was in the order of 2,823,000 t.

In 1984/85 the quantities processed reached almost 5 million tonnes. This was made up of:

1. Dried (dehydrated) products	1,140,509 t.
2. Potato crisps	1,112,098 t.
3. Pre-cooked chips (deep-frozen and chilled)	2,251,610 t.
4. Other pre-cooked products	155,764 t.
5. Other products	256,346 t.

The potato-processing industry is continuing to grow and is destined for further growth, particularly so far as pre-cooked deep-frozen chips are concerned. The varieties grown for industrial purposes characteristically have a high dry matter content and a low level of reducing sugars. Among the most frequently used varieties are Bintje, Saturna, Désirée, Maritta, Irmgard, Primura, etc.

## 6. Nutritional value of the potato

In recent years the consumption of potatoes has fallen dramatically, due largely to differences in diets in the EEC countries.

There are, however, other factors that have influenced this decline in consumption, such as:

- women going out to work,
- the very widespread belief in the public mind that potatoes are fattening.

In this connection it is worth recalling that the calory count is closely linked to the way the potatoes have been cooked (1).

- potatoes boiled in water	70 calories/100 g
- mashed potatoes	95 calories/100 g
- chips	250 calories/100 g
- crisps	513 calories/100 g

From the physiological point of view it is worth pointing out an additional quality of the potato, namely, its alkalinity, a balancing factor in meat dishes and a contributory factor in the care of "acetonomic" children (particularly when after boiling in water).

## II. CHARACTERISTICS OF THE POTATO MARKET

### 1. Technical and economic aspects

According to a survey carried out for the Directorate-General for Agriculture the production costs for potatoes vary considerably from one country to another. These costs are influenced by two factors - the average yield per hectare and the cost of seed potatoes:

- the potato is a perishable product, comparable to fruit and vegetables. Because of its very high water content (75/80%) it is susceptible to the weather, and yields and quality are therefore very variable. It is consequently very difficult to adapt supply to demand;
- potato consumption looks likely to remain stationary; the Community average (EEC 10) is in the order of 75-76 kg per head, a figure that covers both fresh and processed potatoes;
- the demand for potatoes is inelastic, which means that in the years when there is surplus production the price of potatoes will remain low for the whole of the marketing year and, conversely, when there is a shortfall prices will be high;
- prices for new potatoes are generally speaking higher than those for ware potatoes. Their prices vary according to the variety and where they come from ;
- from the commercial point of view the markets for new potatoes and for ware potatoes are closely related. When a plentiful supply of ware potatoes has been produced the market for new potatoes will be depressed, and vice versa.

## 2. Price trends

### a) Ware potatoes:

Prices vary quite considerably from one year to the next, tending to rise and then fall over one or two years. These variations are due to market reactions, but also to the weather, to the inelasticity of demand, to the perishable nature of the product, to the structural aspect of production and, finally, to the effect that the weather has on consumption of fresh potatoes. Because of the inelasticity of demand, the prices for ware potatoes will continue on the same trend throughout a marketing year.

### b) New potatoes :

The price of new potatoes is higher than that of ware potatoes, and rarely falls below 13/14 ECU/100 kg (price recorded for the Sirtema variety from Naples on the Munich market). The price of new potatoes varies according to when they are being marketed (high in March-April at the start of the season, lower in June-July towards the end of the season), but also according to where they come from. The price of new potatoes is subject to the vagaries of the weather (rain, snow) which can delay harvesting or delivery. The prices profile during a marketing year can show erratic trends.

c) Seed potatoes :

Seed potato prices are also higher than those of ware potatoes. They vary according to variety and to source. The ratio of the price of seed potatoes to that of ware potatoes varies from 5/1 to 3/1 according to the size of the potato harvest as a whole.

3. Production structures and market organisations in the member countries

The area set aside for potato production in the member countries varies considerably per holding. The most recent data available give an average of 3.6 ha in the United Kingdom, 0.3 ha in Italy, 3.8 ha in the Netherlands and 0.4 ha in France.

As for market organisation, the United Kingdom has the most complicated structure with its "Potato Marketing Board".

In 1986 there were 22,565 producers registered in this organisation, with an area of about 167,000 ha. To be registered with the Board producers must farm an area of at least 0.4 ha. The British farmers who are members of the Board pay a levy according to the number of hectares cropped. In 1987 this was £76.30 per hectare. In the event of over-production the farmers can supply the Board with a quantity of their potatoes at a price fixed in advance on the basis of a contract drawn up between producers and the Board.

These contract prices for 1987 fluctuated between £47/t (November delivery) and £59/100 kg. (May-June delivery).

The quantities that have been the subject of intervention in the past have been in the order of 500,000 t.

The trade organisations that exist in France and the Netherlands seek to improve production quality and the distribution circuits. In France state aids can be available, especially for new potatoes. STOPA, in the Netherlands, is a controlling body over the seed potato sector on a trade basis.

"Irish Potato Marketing" in Ireland is an organisation similar to the UK Board that tries to restore market balance, in the event of over-production, through the processing industry. The markets of the other EEC countries are characterised by total freedom as regards both production and marketing.

#### 4. Current situation regarding regulation

The draft EEC Regulation is still pending before the Council and will require a certain amount of amendment because of the new direction taken by the Common Agricultural Policy.

Until such time as discussions are resumed it might be possible to consider establishing marketing standards at Community level both for ware potatoes and for new potatoes.

#### 5. Creation of a consultative committee

The autumn of 1987 will see a consultative committee coming into operation. The aim of this committee, which has been set up between the EEC and the Mediterranean countries, will be to improve the transparency of the market through an exchange of information on potato crops and the likely supply of both ware and new potatoes.

### III. Conclusions

Potato production continues to be of importance in the EEC.

The Community is self-sufficient so far as ware potatoes in particular are concerned; it is a net exporter of seed potatoes, but an importer of new potatoes. Trade with the Mediterranean countries is very considerable.

Among the potato-processing industries the processed foods industry is destined for further growth, particularly so far as "pre-cooked deep-frozen chips" are concerned.

Human consumption of potatoes is, on the whole, stationary; a strict quality policy could encourage the consumption of potatoes in certain areas of the Community.

The aim of the "Consultative Committee" which has been set up between the Community and Mediterranean countries will be to improve the transparency of the market. Quality standards for ware and new potatoes could avoid creating barriers to trade, particularly in years of surplus.
