Eurostat hat die Aufgabe, den Informationsbedarf der Kommission und aller am Aufbau des Binnenmarktes Beteiligten mit Hilfe des europäischen statistischen Systems zu decken.

Um der Öffentlichkeit die große Menge an verfügbaren Daten zugänglich zu machen und Benutzern die Orientierung zu erleichtern, werden zwei Arten von Publikationen angeboten: Statistische Dokumente und Veröffentlichungen.

Statistische Dokumente sind für den Fachmann konzipiert und enthalten das ausführliche Datenmaterial: Bezugsdaten, bei denen die Konzepte allgemeinbekannt, standardisiert und wissenschaftlich fundiert sind. Diese Daten werden in einer sehr tiefen Gliederung dargeboten. Die Statistischen Dokumente wenden sich an Fachleute, die in der Lage sind, selbständig die benötigten Daten aus der Fülle des dargebotenen Materials auszuwählen. Diese Daten sind in gedruckter Form und/oder auf Diskette, Magnetband, CD-ROM verfügbar. Statistische Dokumente unterscheiden sich auch optisch von anderen Veröffentlichungen durch den mit einer stilisierten Graphik versehenen weißen Einband.

Die zweite Publikationsart, die Veröffentlichungen, wenden sich an eine ganz bestimmte Zielgruppe, wie zum Beispiel an den Bildungsbereich oder an Entscheidungsträger in Politik und Verwaltung. Sie enthalten ausgewählte und auf die Bedürfnisse einer Zielgruppe abgestellte und kommentierte Informationen. Eurostat übernimmt hier also eine Art Beraterrolle.

Für einen breiteren Benutzerkreis gibt Eurostat Jahrbücher und periodische Veröffentlichungen heraus. Diese enthalten statistische Ergebnisse für eine erste Analyse sowie Hinweise auf weiteres Datenmaterial für vertiefende Untersuchungen. Diese Veröffentlichungen werden in gedruckter Form und in Datenbanken angeboten, die in Menütechnik zugänglich sind.

Um Benutzern die Datensuche zu erleichtern, hat Eurostat Themenkreise, d. h. eine Untergliederung nach Sachgebieten, eingeführt. Daneben sind sowohl die Statistischen Dokumente als auch die Veröffentlichungen in bestimmte Reihen, wie zum Beispiel „Jahrbücher“, „Konjunktur“, „Methoden“, untergliedert, um den Zugriff auf die statistischen Informationen zu erleichtern.

Y. Franchet
Generaldirektor

It is Eurostat's responsibility to use the European statistical system to meet the requirements of the Commission and all parties involved in the development of the single market.

To ensure that the vast quantity of accessible data is made widely available, and to help each user make proper use of this information, Eurostat has set up two main categories of document: statistical documents and publications.

The statistical document is aimed at specialists and provides the most complete sets of data: reference data where the methodology is well established, standardized, uniform and scientific. These data are presented in great detail. The statistical document is intended for experts who are capable of using their own means to seek out what they require. The information is provided on paper and/or on diskette, magnetic tape, CD-ROM. The white cover sheet bears a stylized motif which distinguishes the statistical document from other publications.

The publications proper tend to be compiled for a well-defined and targeted public, such as educational circles or political and administrative decision-makers. The information in these documents is selected, sorted and annotated to suit the target public. In this instance, therefore, Eurostat works in an advisory capacity.

Where the readership is wider and less well defined, Eurostat provides the information required for an initial analysis, such as yearbooks and periodicals which contain data permitting more in-depth studies. These publications are available on paper or in Videotext databases.

To help the user focus his research, Eurostat has created 'themes' i.e. a subject classification. The statistical documents and publications are listed by series, e.g. yearbooks, short-term trends or methodology, in order to facilitate access to the statistical data.

Y. Franchet
Director-General

Pour établir, évaluer ou apprécier les différentes politiques communautaires, la Commission des Communautés européennes a besoin d'informations.

Eurostat a pour mission, à travers le système statistique européen, de répondre aux besoins de la Commission et de l'ensemble des personnes impliquées dans le développement du marché unique.

Pour mettre à la disposition de tous l'importante quantité de données accessibles et faire en sorte que chacun puisse s'orienter correctement dans cet ensemble, deux grandes catégories de documents ont été créées: les documents statistiques et les publications.

Le document statistique s'adresse aux spécialistes. Il fournit les données les plus complètes: données de référence où la méthodologie est bien connue, standardisée, normalisée et scientifique. Ces données sont présentées à un niveau très détaillé. Le document statistique est destiné aux experts capables de rechercher, par leurs propres moyens, les données requises. Les informations sont alors disponibles sur papier et/ou sur disquette, bande magnétique, CD-ROM. La couverture blanche ornée d'un graphisme stylisé démarque le document statistique des autres publications.

Les publications proprement dites peuvent, elles, être réalisées pour un public bien déterminé, ciblé, par exemple l'enseignement ou les décideurs politiques ou administratifs. Des informations sélectionnées, triées et commentées en fonction de ce public lui sont apportées. Eurostat joue, dès lors, le rôle de conseiller.

Dans le cas d'un public plus large, moins défini, Eurostat procure des éléments nécessaires à une première analyse, les annuaires et les périodiques, dans lesquels figurent les renseignements adéquats pour approfondir l'étude. Ces publications sont présentées sur papier ou dans des banques de données de type vidéotex.

Pour aider l'utilisateur à s'orienter dans ses recherches, Eurostat a créé les thèmes, c'est-à-dire une classification par sujet. Les documents statistiques et les publications sont répertoriés par série — par exemple, annuaire, conjoncture, méthodologie — afin de faciliter l'accès aux informations statistiques.

Methodik und Quellen

1. Festes Basisjahr im Vergleich zu verketteten Indizes

1.1 Im folgenden wird erläutert, wie Eurostat die Außenhandelsindizes berechnet. Es handelt sich um verkettete Indizes nach Fisher; mit anderen Worten: Es findet jedes Jahr eine Umbasierung statt. Das Basisjahr für die Indizes von 1989 ist 1988, das für die Indizes von 1990 ist 1989 usw. Jeder Index wird in Werten von 1985 als Bezugsjahr (1985=100) ausgedrückt, indem alle Indizes zurück bzw. bis zum Jahr 1985 miteinander verkettet werden.

1.2 Verkettete Indizes haben einige Vorteile. Erstens werden die für die Berechnung des Index verwendeten Indexgewichte von aktuellen vermarkteten Werten und Mengen abgeleitet, so daß sie die wechselnden Gegebenheiten des Welthandels widerspiegeln.

1.3 Ein zweiter Vorteil verketteter Indizes liegt darin, daß sie gegenüber außergewöhnlichen Ereignissen, wie z.B. einem zeitweisen Anstieg der Preise für Gebrauchsgüter, robuster sind. Geschieht dies im Basisjahr, kann es die Gewichtung eines Index mit einem festen Basisjahr bis zu seiner Umbasierung verzerren.

1.4 Da die Kombinierte Nomenklatur sich jedes Jahr aufgrund der Untergliederung und Zusammenfassung einzelner Gruppen ändert, besteht ein dritter Vorteil darin, daß bei einer jährlichen Umbasierung bessere Qualitätsvergleiche möglich sind. Die Alternative wäre, Produktgruppen zu finden, die über einige Jahre unverändert bleiben; diese müßten dann jedoch eine größere Zahl von Produkten umfassen.

1.5 Die Benutzer der Außenhandelsindizes innerhalb der Kommission haben ein besonderes Interesse an guten Indikatoren für kurzfristige Trends bekundet. Nur wenige würden die Überlegenheit verketteter Indizes für diesen Zweck bestreiten, was in großem Maß für diese Indizes sprach. Obwohl sie als mittel- und langfristige Indikatoren weitaus umstrittener sind, wird ihnen in der jüngeren Literatur zu diesem Thema doch der Vorzug gegeben.

2. Die Wahl der Indexformel

2.1 Die Mitgliedstaaten verwenden unterschiedliche Formeln zur Berechnung der Außenhandelsindizes. Vier Länder verwenden die Fisher-Formel für Durchschnittswertindizes, vier die Paasche-Formel und ein Land die Formel nach Laspeyres. Benutzer innerhalb der Kommission haben sich für Fisher-Indizes ausgesprochen. Über einen längeren Zeitraum weichen die Laspeyres- und Fisher-Indizes voneinander ab. Es gibt keinen Grund anzunehmen, daß der eine zu "genaueren" Ergebnissen führt als der andere. Andererseits kommt der verkettete Fisher-Index als geometrisches Mittel der beiden der Tornqvist-Theil Annäherung an den Divisia-Index, der sehr viele Fürsprecher hat, sehr nahe.

2.2 Die konventionellen Indexformeln werden zur Berechnung der Verkettungen zwischen Jahr, Monat und Durchschnitt des vorangegangenen Jahres eingesetzt.

Durchschnittswertindex nach Laspeyres:

$$(1) \quad \frac{\sum_{i=1}^n V(y-1, i) \frac{u(y, m, i)}{U(y-1, i)}}{\sum_{i=1}^n V(y-1, i)}$$

Durchschnittswertindex nach Paasche:

$$(2) \quad \frac{\sum_{i=1}^n v(y, m, i)}{\sum_{i=1}^n v(y, m, i) \left/ \frac{u(y, m, i)}{U(y-1, i)} \right.}$$

Wertindex:

$$(3) \quad \frac{\sum_{i=1}^n v(y, m, i)}{\sum_{i=1}^n V(y-1, i)}$$

Volumenindex nach Laspeyres:

$$(4) \frac{\text{Wertindex}}{\text{Durchschnittswertindex nach Paasche}}$$

Volumenindex nach Paasche:

$$(5) \frac{\text{Wertindex}}{\text{Durchschnittswertindex nach Laspeyres}}$$

Fisher-Index:

$$(6) \sqrt{\text{Laspeyres Index} \times \text{Paasche Index}}$$

wobei:

$v(y,m,i)$ = Handelswert des Artikels i für den Monat m des Jahres y

$$V(y-1,i) = \frac{1}{12} \sum_{m=1}^{12} v(y-1,m,i)$$

$u(y,m,i)$ = Durchschnittswert des Artikels i für den Monat m des Jahres y

$U(y-1,i)$ = mittlerer Durchschnittswert des Artikels i für das Jahr $y-1$, berechnet als Gesamtwert dividiert durch Gesamtmenge.

2.3 Für die Gewichte beim Paasche-Index (2) werden - trotz ihrer größeren Instabilität - eher die Werte des laufenden Monats als die des gesamten laufenden Jahres verwendet. Der Grund hierfür liegt einmal in der Aufrechterhaltung der Beziehung (4) und zum anderen in der Tatsache, daß die jährlichen Gewichte erst am Ende des laufenden Jahres vorliegen.

3. Datenquellen

3.1 Die wichtigsten Datenquellen sind die auf der Grundlage der KN erstellten Handelsstatistiken, die die Mitgliedstaaten an Eurostat liefern. Bei folgenden Produktgruppen (definiert in der SITC Rev.3) ergeben die auf der Basis von Handelsdaten berechneten Durchschnittswerte einen unbefriedigenden Hinweis auf die Preisentwicklung:

SITC 525 Radioaktive Stoffe und dergleichen

SITC 667 Echte Perlen, Edelsteine und Schmucksteine, roh oder bearbeitet

SITC 792 Luftfahrzeuge und zugehörige Ausrüstungen; Raumfahrzeuge (einschließlich Satelliten) und Trägerraketen für Raumfahrzeuge, Teile davon

SITC 793 Wasserfahrzeuge (einschließlich Luftkissenfahrzeuge) und schwimmende Vorrichtungen

SITC 883 kinematografische Filme, belichtet und entwickelt, auch mit Tonaufzeichnung oder nur mit Tonaufzeichnung

SITC 896 Kunstgegenstände, Sammlungsstücke und Antiquitäten

SITC 897 Schmuckwaren, Gold- und Silberschmiedewaren und andere Waren aus Edelmetallen, Edelsteinen oder Schmucksteinen a.n.g.

Derzeit wird die Durchschnittswert-Veränderung jeder dieser Gruppen auf der Grundlage anderer Durchschnittswertreihen unterstellt (anhand der Durchschnittswert-Veränderungen der anderen berücksichtigten Güter, die zum selben zweistelligen SITC-Code gehören).

3.2 Die Rohdaten werden klassifiziert nach Berichtsland, Warenstrom, 8-stelligem Gütercode der KN und Partnerland. Eurostat arbeitet mit Daten auf dieser detaillierten Gliederungsebene. Die meisten Länder berechnen ihre Indizes, nachdem die Daten bezüglich sämtlicher Partnerländer zusammengefaßt wurden. Dies hat einige offensichtliche Vorteile. Neben der Verringerung der Dimensionalität der Daten, wird auch die Anzahl der Datenlücken gesenkt. So wird unter Umständen der Handel mit einem bestimmten Partnerland nur für wenige Monate im Jahr verzeichnet, während mit einigen Partnerländern fast über das gesamte Jahr Handel stattfindet. Auf der anderen Seite zeigt sogar schon eine flüchtige Untersuchung der Durchschnittswertreihen aufgeschlüsselt nach Partnerländern, daß die Hypothese eines gemeinsamen Durchschnittswerts sehr häufig unrealistisch ist. Dies liegt entweder daran, daß gleiche Güter für unterschiedliche Partner unterschiedliche Preise haben, oder daran, daß die 8-stellige KN-Kategorie eine Vielzahl von Qualitäten oder Gütertypen erfaßt und daß unterschiedliche Partner unterschiedliche Mengen dieser einzelnen Güter nachfragen oder liefern. Aus diesem Grund können

Durchschnittswerte, die durch Aggregation bezüglich der Partnerländer berechnet werden, aufgrund der instabilen Aufschlüsselung des Handels nach Partnerländern schwanken. Die gleichen Argumente gelten auch für die Aggregation bzw. genaue Aufschlüsselung von Produkten. Auf jeden Fall sind Informationen über das Partnerland ein Mittel, um Durchschnittswerte in homogenere Produktgruppen zu schichten. Aus diesem Grund werden die Durchschnittswertindizes von Eurostat auf der Grundlage der Originaldaten ohne Aggregation nach Partnern oder Produkten berechnet.

3.3 Eine Ausnahme für die Regel der Nichtaggregation tritt ein, wenn die KN zwischen zwei Jahren geändert wird. In diesem Fall werden die Produkte zu einem Aggregat zusammengefaßt, das für beide Jahre gleich definiert ist. Änderungen hinsichtlich der geographischen Definition der Partnerländer sind äußerst selten und normalerweise nebensächlich. In diesem Fall werden die Länderpaare so gut wie möglich miteinander abgeglichen.

3.4 Für die meisten KN-Codes gibt es Informationen über Wert, Gewicht und bisweilen eine zweite, zusätzliche Mengeneinheit, wie z.B. Stückzahl. In diesem Fall gibt es zwei Durchschnittswerte (Wert je Tonne und Wert je zusätzlicher Einheit). Ein auf der Basis einer zusätzlichen Einheit (z.B. Wert je Kraftfahrzeug) berechneter Durchschnittswert muß nicht unbedingt einen besseren Preismaßstab ergeben als der Wert je Tonne. Wenn viele Produkte unter einem KN-Code erfaßt werden und ihr Preis genau auf ihr Gewicht abgestimmt ist, wird sich der Wert je Tonne durch die Schwankungen in der Güterzusammensetzung nicht ändern. Ein weiterer Faktor ist die Zuverlässigkeit, mit der das Gewicht bestimmt wird, verglichen mit der Zuverlässigkeit der zusätzlichen Einheit. Hinsichtlich europäischer Daten haben indirekte Überprüfungen ergeben, daß das Gewicht in der jüngsten Zeit zuverlässiger bestimmt werden konnte als die zusätzlichen Einheiten, und dementsprechend wird im allgemeinen der Durchschnittswert je Tonne verwendet. Langfristig können technische Veränderungen zu erheblichen Verzerrungen bei beiden Arten von Durchschnittswerten führen.

3.5 Eine Art, die Vertraulichkeit bei den die KN-Daten zu wahren, ist, den Handel mit einem bestimmten Produkt, einem spezifischen geographischen Code zuzuordnen, um den Ursprung oder die Bestimmung des Produkts unkenntlich zu machen. Bei einigen Produkten spielt dies eine wichtige

Rolle, und der Anteil des angemeldeten Handelswertes am tatsächlichen Wert für eine bestimmte Ländergruppe (z.B. Extra-EG) kann monatlich schwanken. Derzeit wird nicht versucht, die Volumenindizes anzupassen, um diese Fluktuationen auszugleichen.

3.6 KN-Daten geben den Handelswert in Tausend ECU wieder. Alle Durchschnittswertindizes von Eurostat werden in Ecu ausgedrückt. Die Umrechnung in andere Währungseinheiten ist einfach.

3.7 Die EG-Daten werden ebenfalls nach dem statistischen Verfahren aufgeschlüsselt, so daß zum Beispiel für die Weiterverarbeitung eingeführte Güter, die wieder in ihr Ursprungsland zurückexportiert werden, von normalen Einfuhren unterscheidbar sind. Lediglich der Normalhandel (statistisches Verfahren 1) wird zur Berechnung der Durchschnittswertindizes zugrundegelegt, obwohl für die Wertindizes, mit deren Hilfe die Volumenindizes berechnet werden, der Gesamthandel zugrunde gelegt wird.

3.8 Fehler in den monatlichen Daten werden erst Monate später berichtigt. Daher würde ein jährlicher Index, der auf den aggregierten zwölf Monatswerten basiert, ebenfalls Fehler enthalten. Dennoch gibt es teilweise berichtigte jährliche Daten. Sie werden zur Berechnung der jährlichen Volumenindizes verwendet, die zurück bis zum Bezugsjahr verkettet werden. Dort, wo die monatlichen Daten Fehler enthalten, können diese auch die monatlichen und vierteljährlichen Volumenzahlen verzerren. Daher treten bei detaillierteren Indizes gelegentlich Unterschiede zwischen dem jährlichen Durchschnitt des monatlichen und vierteljährlichen Volumenindex und dem jährlichen Index auf.

4. Behandlung von Extremwerten

4.1 Die administrativen Verfahren zur Validierung von Handelsdaten sind von Land zu Land unterschiedlich. Da die monatlichen Daten, die von Eurostat zur Indexberechnung herangezogen werden, sozusagen die erste Ausgabe dieser Daten darstellen, werden in der Folge häufig wesentliche Änderungen vorgenommen, und es ist eine bedauernde Tatsache, daß erhebliche Veränderungen des Durchschnittswertes durchaus gang und gäbe sind. In einer Stichprobe von Daten gab es einen Durchschnittswert der 700 mal größer war als der des Vorjahres. Im allgemeinen geht man davon aus, daß zugrundeliegende Preise verhältnismäßig ge-

ringfügig schwanken. Diese Extremwerte sind daher entweder auf verschiedenartige Aufzeichnungsfehler zurückzuführen oder auf die Inhomogenität der Daten. Was auch immer der Grund sein mag, eine "breitschwänzige" Verteilung von Durchschnittswertveränderungen kann zu der normalen Indexformel führen, die unzuverlässige Resultate ergibt. Eurostats Methode zur Behandlung dieser breitschwänzigen Verteilungen ist das robuste Regressionsverfahren, wie es zuerst von Hinich und Talwar beschrieben wurde.

4.2 Dieses Verfahren beruht auf der Beobachtung, daß, während das Niveau der Durchschnittswerte von Partnerland zu Partnerland variieren kann, die Veränderungen der Niveaus jedoch sehr ähnlich sind, und zwar nicht nur von Partnerland zu Partnerland sondern auch bei ähnlichen Produkten, verglichen mit dem Niveau von "Hintergrundgeräuschen" bei Durchschnittswertdaten. Eine Untersuchung von Eurostat zeigt jedoch bedeutende Schwankungen zwischen den Berichtsländern (im Zusammenhang mit Wechselkurschwankungen usw.). Daher hat Eurostat die Rohdaten in ca. 200 Datenblöcke für jedes Berichtsland und jeden Warenstrom eingeteilt. Jeder Block enthält Daten für eine bestimmte Gruppe von 8-stelligen KN-Gütercodes und alle Partnerländer für diese Codes. Dahinter steht die Annahme, daß sich innerhalb eines Blocks die Durchschnittswerte aller Angaben gleich verhalten.

4.3 Auf diese Weise werden die Artikel berücksichtigt, deren Durchschnittswert sich im Verhältnis zur mittleren Durchschnittswertveränderung (gemessen am Median) des gesamten Blockes innerhalb bestimmter Grenzen ändert (z.B. +/-10%) und die anderen werden vorläufig nicht berücksichtigt. Vorläufig nicht berücksichtigt werden könnte ein Artikel, weil der entsprechende Durchschnittswert des Monats m-1 von zweifelhafter Qualität ist oder überhaupt nicht vorliegt. Daher werden diese Artikel in bezug auf ein weiteres Monatspaar überprüft. Normalerweise wird dann die Veränderung zwischen Monat m und Monat m-2 verwendet. Der Artikel wird berücksichtigt, sofern er den zweiten Test besteht. Diese Regeln wurden von einem einfachen Wahrscheinlichkeitsmodell für die Häufigkeit von hohen und niedrigen Ausreißern abgeleitet. Dadurch werden zwar unbrauchbare Beobachtungen im laufenden Monat ausgesondert, diese Regeln geben jedoch keinerlei Schutz gegen Ausreißer in den Durchschnittswerten des Basisjahres. Eine Lösung wäre, die jährlichen Zahlen nur anhand der Daten der Monate zu

berechnen, in denen der Artikel berücksichtigt wurde. Aus technischen Gründen wird dies derzeit jedoch nicht praktiziert. Stattdessen wird ein Artikel ebenfalls nicht berücksichtigt, wenn das Verhältnis des Durchschnittswertes für den laufenden Monat zu dem des Basisjahres außerhalb der Streubreite liegt ([0,2 : 5,0]). Diese Streubreite wurde nach Analyse der typischen Preisschwankungen für saisonale und nichtsaisonale Güter festgesetzt und kann unter ungewöhnlichen Umständen geändert werden.

4.4 Das oben beschriebene Aussonderungsverfahren hat den Vorteil, daß von Monat zu Monat Durchschnittswertverhältnisse erkannt werden können, die im Vergleich zu der allgemeinen Entwicklung in der entsprechenden Klasse (=Block) als extrem zu bezeichnen sind. Dies ist wahrscheinlich befriedigender, als einen willkürlichen Rahmen für absolute Schwankungen festzusetzen. Der nächste Schritt ist die Berechnung von Laspeyres- und Paasche-Indizes für den laufenden Monat (mit dem vorangegangenen Jahr als Basisjahr) auf der Grundlage lediglich der berücksichtigten Artikel. Diese werden dann verwendet als Schätzwert für die Durchschnittswertveränderung von Artikeln, deren Durchschnittswerte nicht berücksichtigt wurden. Die Definition der Blöcke erfolgt unabhängig von den endgültigen Indizes und die darin enthaltenen Daten können für die Berechnung mehrerer endgültiger Indizes verwendet werden. Für jeden Index wird der monatliche Wert und der jährliche Wert von Artikeln mit einem von null verschiedenen Handel aufgezeichnet, die die obengenannten Überprüfungen bestanden haben. Danach werden aktuell gewichtete und anhand der Basisperiode gewichtete Stichprobenabdeckungsquoten berechnet (d.h. berücksichtigter Wert als Prozentzahl des Gesamtwerts) und für die Stichprobenabdeckung wird als Kompromißwert der geometrische Durchschnitt genommen.

4.5 Die Wertverkettungen für Indizes werden anhand aller Artikel und nicht nur der berücksichtigten berechnet. Dahinter steht der Gedanke, daß zweifelhafte Durchschnittswerte allein auf Fehlern bei den Mengen zurückzuführen sind. Normalerweise werden durchschnittlich ca. 11% des aktuellen Werts von Artikeln nicht berücksichtigt (das entspricht einer Stichprobenabdeckung von 89%). In den Tabellen dieser Veröffentlichung sind Artikel, bei denen die Stichprobenabdeckung zwischen 25 % und 50 % liegt, mit "*" gekennzeichnet. Artikel mit einer Stichprobenabdeckung unter 25 % sind nicht ausgewiesen.

4.6 Es hat sich herausgestellt, daß der Ausschluß von Artikeln mit einem niedrigen Handelswert im Vorjahr zwar keinen Einfluß auf die Indexverkettungen hat, die mittels des Wertes gewichtet werden; da diese Artikel jedoch sehr zahlreich sind, können die rechnerischen Operationen reduziert werden. Derzeit werden bei der Berechnung der Durchschnittswertindizes Artikel mit einem Basisjahrwert unter 100.000 ECU bzw. 1 % des Basisjahrwerts ihres entsprechenden Blocks, je nachdem welcher Wert geringer ist, nicht berücksichtigt. Das führt dazu, daß durchschnittlich 3 % des gesamten Handelswertes nicht erfaßt werden, zahlenmäßig sind dies jedoch über 70 % aller Artikel.

5. Berechnung der monatlichen Indexverkettungen

5.1 Zu Beginn jeden Jahres werden die KN-Codes des vorangegangenen Jahres und diejenigen des laufenden Jahres zu Blöcken und Indizes in Beziehung gesetzt. Die kumulativen jährlichen Daten für das Vorjahr werden aufbereitet und enthalten die nach Warenstrom, Produkt und Partnerland definierten Artikel, die über dem Schwellenwert des jeweiligen Blocks liegen. Bei Änderungen der KN werden Produktaggregate gebildet, die in beiden Jahren die gleiche Zusammensetzung haben. Ferner gibt es noch einige wenige saisonale KN-Codes, die zu einem das ganze Jahr abdeckenden Produktaggregat zusammengefaßt werden.

5.2 Jeden Monat werden die 'separaten' monatlichen KN-Daten für die berücksichtigten Artikel Block für Block aufbereitet, um die Laspeyres- und Paasche-Zähler bzw. Nenner für die wichtigsten benötigten Indizes zu ermitteln. Diese Information wird gespeichert und in einer späteren Phase der Aufbereitung zur Berechnung von Indexverkettungen auf einer höheren Ebene von Produkt- oder Ländergruppenaggregaten wieder verwendet. Daneben können in dieser Phase externe Preisinformationen mit den Durchschnittswertindizes verknüpft werden.

5.3 Für einige Gütersystematiken werden Gruppen von Indizes berechnet. Höhere Ebenen von Produktklassen (z.B. SITC Einsteller) werden durch Aggregation der Zähler und Nenner der konstituierenden Indizes gebildet. Manchmal fehlt ein derartiger Index bei kleinen Ländern für einen Monat. Dann ist entweder der Handel gleich null, oder die Stichprobenabdeckungsquote wird als zu niedrig erachtet, um einen zuverlässigen Durchschnitts-

wertindex ermitteln zu können. Es hat sich als unbefriedigend erwiesen, den größeren Index einfach durch Aggregation der zufällig vorliegenden Indizes zu berechnen, da, wenn der fehlende Index ein großes Gewicht und eine von den anderen Indizes unterschiedliche Höhe hat, der aggregierte Index schwanken wird, je nachdem, ob dieser Index in der Berechnung berücksichtigt wird oder nicht. Eurostats Lösung besteht darin, die Höhe des fehlenden Durchschnittswertindex und (falls der Handel gleich null ist) ebenfalls das Indexgewicht für den Paasche-Index zu schätzen.

5.4 Die Indizes für die EG als Berichtseinheit werden durch Verknüpfung der einzelnen Länderindizes ermittelt. Die Durchschnittswert- und Volumenindizes nach Laspeyres für die EG werden berechnet durch Gewichtung der Laspeyres-Indizes jedes einzelnen Berichtlandes mittels des Handelswertes des Vorjahres (vor Ausschluß von Artikeln unterhalb des Schwellenwerts). Ein Wertindex für die Gemeinschaft wird gebildet durch die Verknüpfung der Wertindizes der einzelnen Berichtsländer mit den gleichen Gewichten. Die Paasche-Indizes für die EG ergeben sich durch Division.

5.5 Normalerweise liegen für die neuen Mitgliedstaaten keine KN-Daten vor, die sich auf die Jahre vor ihrem Beitritt beziehen. Daher wurde der EG-Index bis Dezember 1981 ohne Griechenland als Berichtland berechnet und bis Dezember 1985 ohne Spanien und Portugal. Dementsprechend wird ein Index für 1986 berechnet, indem die Veränderung für EUR 12 zwischen 1985 und 1986 auf die Höhe des Index für EUR10 des Jahres 1985 Bezug nimmt.

6. Verkettung

6.1 Die monatlichen Laspeyres und Paasche Volumenindizes ergeben einen Volumenindex für den laufenden Monat im Vergleich zum Durchschnitt der (separaten) Daten für das Vorjahr. Die vierteljährlichen Durchschnittswert- und Volumenindizes werden durch Summierung der monatlichen Indizes über ein Vierteljahr und nachfolgende Division durch drei berechnet. Die jährlichen Durchschnittswertindizes ergeben sich durch Summierung der vierteljährlichen Indizes und die nachfolgende Division durch vier. Der jährliche Wertindex zur Berechnung des Volumenindex beruht vielmehr auf überprüften jährlichen Daten (kumulativ) als auf den ursprünglichen monatlichen Werten. Dies kann mehr oder weniger große Unterschiede beim

unterstellten monatlichen Wertindex zur Folge haben! Grund für dieses Phänomen ist die Verkettung mit den jährlichen Indizes. So sind die vierteljährlichen und jährlichen Durchschnittswertindizes im Endeffekt Mittelwerte der monatlichen Durchschnittswertindizes, die mit den monatlichen Volumenindizes gewichtet werden. Zur Erhaltung der Beziehung 'Volumen x Durchschnittswert-Veränderung = Wertveränderung für alle Periodizitäten wird dieser Methode der Vorzug gegeben vor der einfachen Ermittlung des Durchschnitts aus den monatlichen Durchschnittswertindizes. Die so berechneten jährlichen Indizes können von denjenigen, die direkt auf der Grundlage der jährlichen Daten berechnet werden, abweichen, teilweise aufgrund des Ausschlusses extremer monatlicher Durchschnittswerte.

6.2 Sobald die jährlichen Verknüpfungen ermittelt sind, werden die Indizes rückwärts (und vorwärts) zum Bezugsjahr (derzeit 1985) verkettet.

Beispiel wie man ein Index für den Monat m im Jahr y rückwärts mit dem Bezugsjahr 1985 verkettet:

$$\begin{aligned}
 &= 100 \times (\text{jährliche Verkettung für 1986,} \\
 &\quad \text{Basis 1985)} \\
 &\quad \times (\text{jährliche Verkettung für 1987,} \\
 &\quad \text{Basis 1986)} \\
 &\quad \times \dots\dots\dots \\
 &\quad \times (\text{jährliche Verkettung für das Jahr } y-1, \\
 &\quad \text{Basis } y-2) \\
 &\quad \times (\text{monatliche Verkettung für den Monat} \\
 &\quad \text{ } m, \text{ Jahr } y, \text{ Basisjahr } y-1).
 \end{aligned}$$

Methodology and Sources

1. Fixed Base versus Chained Indices

1.1. This introduction sets out how Eurostat's external trade indices are calculated. The indices are of the chained Fisher type. In other words: the base year is revised each year. The 1989 indices have 1988 as base year, the 1990 indices have 1989 as base year, and so on. Each index is expressed in terms of 1985 as reference year (i.e., 1985 = 100) by chaining all the Links back and up to 1985.

1.2. Chain indices have several attractive properties. Firstly, the index weights used to construct the index will be derived from recent values and quantities traded, and will therefore be responsive to the changing patterns of world trade.

1.3. A second advantage of chain indices is that they are more robust in the face of an abnormal event such as a temporary peak in commodity prices. If this occurs in the base year, it can distort the weighting of a fixed base index until it is rebased.

1.4. Thirdly, as the Combined Nomenclature (CN) changes each year due to the subdivision and regrouping of subheadings, better quality comparisons are made by focusing on year to year changes. The alternative is to define groupings over a wider range of products which are stable for several years.

1.5. There was a particular interest in obtaining good indicators of short-term trends expressed by users of external trade indices within the Commission. Few would deny the superiority of chain indices for this purpose. This was a major factor in their favour. Though there is more controversy about their advantages as medium- and long-term indicators, many recent writers on the subject prefer them.

2. The Choice of Index Formula

2.1. The Member States use various formulae to calculate external trade indices. Four countries use a Fisher formula for Unit Value indices, four use Paasche and one uses Laspeyres. Users within the Commission expressed a preference for indices of the Fisher type. Over the longer term, chain Laspeyres and Paasche indices drift apart. There does not appear to be any reason to believe that one

gives a 'truer' result than the other. On the other hand, the chain Fisher index, a geometric average of the two, closely approximates the Törnqvist-Theil approximation to the Divisia index, which has a number of advocates.

2.2. The conventional index formulae are used for calculating the Links between year, month and the average of the previous year. These are:

Laspeyres Unit Value Link:

$$(1) \quad \frac{\sum_{i=1}^n V(y-1, i) \frac{u(y, m, i)}{U(y-1, i)}}{\sum_{i=1}^n V(y-1, i)}$$

Paasche Unit Value Link:

$$(2) \quad \frac{\sum_{i=1}^n v(y, m, i)}{\sum_{i=1}^n v(y, m, i) / \frac{u(y, m, i)}{U(y-1, i)}}$$

Value Link:

$$(3) \quad \frac{\sum_{i=1}^n v(y, m, i)}{\sum_{i=1}^n V(y-1, i)}$$

Laspeyres Volume Link:

$$(4) \quad \frac{\text{Value Link}}{\text{Paasche Unit Value Link}}$$

Paasche Volume Link:

$$(5) \quad \frac{\text{Value Link}}{\text{Laspeyres Unit Value Link}}$$

Fisher Link:

$$(6) \quad \sqrt{\text{Laspeyres Link} \times \text{Paasche Link}}$$

where:

$v(y,m,i)$ = value of trade in item i for month m of year y

$$V(y-1,i) = \frac{1}{12} \sum_{m=1}^{12} v(y-1,m,i)$$

$u(y,m,i)$ = Unit Value of item i for month m of year y

$U(y-1,i)$ = average Unit Value of item i for year $y-1$, calculated as total value divided by total quantity.

2.3. The values for the current month rather than those for the whole of the current year are used as weights in the Paasche Link (2), despite their greater instability. The reasons for this choice were firstly to preserve relationship (4) and secondly because the annual weights are not available until after the end of the current year.

3. The data sources

3.1. The primary source of data are the CN trade statistics supplied to Eurostat by the Member States. For the following groups of products (defined in SITC rev.3), unit values calculated from trade data give an unsatisfactory indication of price performance:

SITC 525 Radioactive and associated materials

SITC 667 Pearls, precious and semi-precious stones, unworked or worked

SITC 792 Aircraft and associated equipment; spacecraft (including satellites) and spacecraft launch vehicles; and parts thereof

SITC 793 Ships, boats (including hover craft) and floating structures

SITC 883 Cinematograph film, exposed and developed, whether or not incorporating sound track or consisting only of sound track

SITC 896 Works of art, collectors' pieces and antiques

SITC 897 Jewellery, goldsmiths' and silversmiths' wares, etc.

At present the Unit Value Ratio of each of these groups is implicitly imputed from the Unit Value Ratios of the other non-rejected products belonging to the same SITC 2-digit code.

3.2. The raw data is classified by reporter country, flow, CN product code and partner country. Eurostat's approach is to work with the data at this detailed level. Most countries calculate their indices after the data has been summed over partner countries. This has certain apparent advantages. In addition to reducing the dimensionality of the data, the number of discontinuities is also reduced. Trade with a particular partner may be recorded for only a few months of the year, whereas there is trade with some partners in most months. On the other hand, even a cursory examination of Unit Value series broken down by partner shows that the hypothesis of a common Unit Value is very often unrealistic. This is because either identical goods are priced differently for different partners or because the CN code covers a number of qualities or types of product and different partners demand or supply different proportions of these individual products. Therefore unit values calculated after aggregation over partners may fluctuate because of the instability of the partner breakdown of trade. The same arguments apply to aggregated versus detailed products. In all events, information on the partner is a means of stratifying unit values into more homogeneous product groups. For these reasons, Eurostat's Unit Value indices are calculated from the original data without aggregation over partners or products.

3.3. One exception to the rule of no aggregation is where there is a change in the CN nomenclature between two years. In this case products are combined to produce an aggregate with the same defi-

nition in both years. Changes in the geographical definition of partner countries are much less frequent and are usually insignificant. In this case the most appropriate match between pairs of countries is made.

3.4. For most CN codes there is information on value, weight and sometimes a second, supplementary quantity unit, such as number of items. In this case two types of Unit Value (value per tonne and value per supplementary unit) are available. A Unit Value based on supplementary unit (for example, value per car) is not necessarily a better measure of price than value per tonne. If there are many products covered by a CN code, and if their price is perfectly correlated with their weight, then value per tonne will be unaffected by fluctuations in product composition. The reliability with which weight is measured compared with the reliability of supplementary unit data is also a factor. For European data, evidence from indirect tests suggests that weight seems to have been measured more reliably than supplementary units in the recent past, and so average value per tonne is generally used. Over the longer run, technical change can cause substantial biases in both types of Unit Value.

3.5. One of the ways in which confidentiality is treated in the CN data is to allocate trade in a product to a special geographic code, in order to disguise the origin or destination. There are some products where this is an important factor, and the proportion of the declared value of trade to the actual value for a particular geographic zone (such as Extra-EC) may fluctuate from month to month. No attempt is made at present to adjust the Volume indices to compensate for these fluctuations.

3.6. CN data records the value of trade in thousands of ECUs. All Eurostat's Unit Value indices are expressed in ECU terms. Conversion to other currency units is straightforward.

3.7. The EC data is also broken down by statistical regime, so that, for example, goods imported for intermediate processing before re-exporting them to their country of origin, are distinguished from normal imports. Only normal trade (statistical regime 1) is used to calculate Unit Value indices, though total trade is used for the Value indices from which the Volume indices are calculated.

3.8. Any errors in the monthly data are only corrected months later. Therefore an Annual index based on the 12 months aggregated would contain the errors too. However there are partly corrected annual figures. These are used for calculating the annual Volume Links that are chained back to the reference year. Where they occur, the errors in the monthly data may distort the monthly and quarterly Volume figures. Thus, for the more detailed indices, there are occasional discrepancies between the annual average of the Monthly and Quarterly Volume index, and the Annual index.

4. Dealing with extreme values

4.1. Administrative procedures for validating trade data vary between Member States. Since the monthly data used by Eurostat to calculate indices is the first release of this data, and there are often substantial revisions made subsequently, it is an unfortunate fact that extremely large Unit Value movements are not at all unusual. In one sample of data, a Unit Value 700 times greater than that of the previous year was found. In general, we would expect underlying prices to move fairly smoothly. These extremes are therefore due either to recording errors of one sort or another or due to data inhomogeneity. Whatever the cause, a wide tailed distribution of Unit Value changes can lead to the usual Index formulae giving unreliable results. Eurostat's method for dealing with wide tailed distributions is to use the robust regression technique first described by Hinich and Talwar¹.

4.2. The method starts from the observation that whereas the level of unit values across partner countries may differ, the changes in levels are very similar not only across partner countries but also across related products, compared with the background level of noise in Unit Value data. A study by Eurostat however shows significant variations across reporting countries (e.g. related to exchange rate fluctuations). Eurostat has therefore divided the raw data into some 200 blocks of data for each reporting country and flow. Each block contains data for a particular set of CN product codes and all partner

¹ Hinich M.J., Talwar P.P. 'A simple method for robust regression', *Journal of the American Statistical Association*, March 1975.

countries for these codes. The assumption is that within a block, every data item's Unit Value behaves in the same way.

4.3. Thus the method accepts the items whose Unit Value Ratio relative to the median Unit Value Ratio of the block behaves within certain bounds (for example, plus or minus 10%) and provisionally rejects the others. Provisional rejection of an item may be because the month m-1 Unit Value is of doubtful quality, or is not available. Therefore these items are tested for a second pair of months. Normally the change between months m and m-2 is then used. In this case the item is accepted if it passes the second test. These rules were derived from a simple probabilistic model for the frequency of high and low outliers. Though they weed out unsuitable observations in the current month, they do not give any protection against outliers in the base year unit values. One solution would be to calculate the annual figure only from monthly data where the item was accepted. However for technical reasons this is not done at present. Instead an item is also rejected if the ratio of the Unit Value in the current month to that of the base year is outside the range [0,2;5,0]. This range was set after examination of the typical price variations found in seasonal and non-seasonal goods, and can be changed in unusual circumstances.

4.4. The above rejection procedure has the virtue of identifying a Unit Value ratio as extreme compared with the general movement in its class (= block) from month to month. This is likely to be more satisfactory than setting an arbitrary range for absolute fluctuations. The next step is simply to calculate Laspeyres and Paasche Links for the current month (with last year as base year) using only the accepted items. These are then used as an estimation of the Unit Value Ratio for items whose unit value ratios have been rejected. The definitions of the blocks are independent of the final indices and the data in them may be used by more than one final Index. For each Index a record is kept of the current month value and the base year value of items with non-zero trade that are accepted by the above tests. Current weighted and base period weighted sample coverage ratios are then calculated (i.e. accepted value as a percentage of total value), and a compromise figure for the sample coverage is found by taking the geometric average.

4.5. The Value Links are calculated using all items and not just accepted ones. The implied assumption is that doubtful unit values are due to errors in quantities alone. On average some 11% of the current value of items is rejected (i.e. a sample coverage of 89). The tables in this publication flag items with an asterisk where the sample coverage is between 25% and 50%. Items with a sample coverage below 25% are not shown.

4.6. The exclusion of items with a small value of trade in the previous year has been found to make virtually no impact on the Index Links that are weighted by value. However there is a considerable saving in computational effort since there are large numbers of such items. Currently items with a base year value less than a threshold (= 1% of its block's base year value with a maximum of 100.000 ECU), are not considered when calculating Unit Value indices. This results in excluding on average 3% of the total value of trade, but over 70% of all items by number.

5. Calculation of the monthly Index Links

5.1. At the start of each year, CN codes for the previous year and the current year are related to blocks and to indices. The cumulative annual data for the previous year is processed, retaining items defined by flow/product/partner which are above the threshold for each block. Changes in the CN nomenclature are dealt with by creating product aggregates with the same constituents in both years. There are also a few seasonal CN codes that are combined to give a product aggregate which covers the whole year.

5.2. Each month, the 'isolated' monthly CN data for retained items is processed, block by block, to give Laspeyres and Paasche numerators and denominators for all the primary indices that are required. This information is stored, and used by a further stage of processing to produce index Links at a higher level of product or zone aggregation. In addition external price information may be combined with the Unit Value indices at this stage.

5.3. Sets of indices are calculated for several product nomenclatures. Higher levels of product class (e.g. SITC 1-digit section) are found by ag-

gregation of the numerators and denominators of the constituent indices.

Sometimes a constituent index for a small country is missing for one month. Either its trade is zero, or its sample coverage ratio is judged too low to give a reliable Unit Value Index. It has been found that it is not satisfactory to calculate the larger Index simply by aggregating those constituent indices that happen to be available, since if the missing index has a large weight and has a level different from the others, the aggregate index will jump about as the index comes in and out. Eurostat's solution is to estimate the level of the missing Unit Value index, and (in the case of zero trade) the index weight for the Paasche index.

5.4. Indices for the Community as reporting unit are found by combining the country indices. Laspeyres Unit Value and Volume Links for the EC are calculated by weighting the Laspeyres Links for each individual reporting country by the value of trade for the previous year (before elimination of items under the threshold). A Community Value Link is found by combining the Value Links for individual reporters with the same weights. The Paasche Links for the EC are found by division.

5.5. CN data is usually not available for new Member States in the years before they joined the Community. Therefore the EC index is calculated without Greece as reporting country until December 1981 and refers to the Community without Spain and Portugal until December 1985. Thus a 1986 Index is calculated by splicing the change for EUR12 between 1985 and 1986 into the 1985 level of the index for EUR10.

6. Chaining the Links

6.1. The Monthly Laspeyres and Paasche Volume Links give an index of Volume for the current month relative to the average of the data (isolated) of the previous year. Quarterly Unit Value and Volume Links are calculated by summing the Monthly Links over the quarter and dividing by three. Annual Unit Value Links are found by summing the Quarterly Links and dividing by four. The Annual Value Link used to calculate the Volume Index, is calculated from revised annual data (cumulative), rather than the original monthly values. This can cause more or less important differences in the implied Monthly Value index! The chaining with the Annual Links is

the cause of this phenomena. Thus the Quarterly and Annual Unit Value Links are effectively averages of the Monthly Unit Value Links weighted by the Monthly Volume Links. This method is used, rather than the simple averaging of the Monthly Unit Value Links, to preserve the relationship 'Volume x Unit_Value_Change = Value_Change' for all periodicities. The annual indices so obtained may differ from those that would be calculated from annual data directly, in part due to the elimination of extreme unit values at the monthly level.

6.2. Once the Annual Links have been found, the indices are chained backwards (and upwards) to the reference year (1985 for the moment).

Example of how to chain an index backwards to 1985 for month *m* of year *y* :

$$\begin{aligned}
 &= 100 \times (\text{Annual Link for 1986, base 1985}) \\
 &\quad \times (\text{Annual Link for 1987, base 1986}) \\
 &\quad \times \dots\dots\dots \\
 &\quad \times (\text{Annual Link for year } y-1, \text{ base } y-2) \\
 &\quad \times (\text{Monthly Link for month } m, \text{ year } y, \\
 &\quad \quad \text{base } y-1)
 \end{aligned}$$

Symbols and abbreviations used

BEC	Broad economic categories
NACE CLIO	General industrial classification of economic activities in the European Communities used in the input/output tables
SITC	Standard international trade classification, revision 2
:	Not available
*	Index with a low coverage ratio (< 50 %)
n.e.s.	Not elsewhere specified
VAL	Value Index (denominated in ECU)
VOL	Volume Index
UV	Unit Value Index (denominated in ECU)
$\Delta\%$	Percentage change from the corresponding period of the year before
W	Weight of the product in 1991 relative to the total trade excluding goods n.e.s.

Méthodologie et sources

1. Indices à base fixe contre indices en chaîne

1.1 La présente introduction a pour objet d'indiquer comment les indices du commerce extérieur d'Eurostat sont calculés. Ces indices sont du type Fisher. En d'autres termes, l'année de base est révisée chaque année. Les indices de 1989 ont 1988 comme année de base, les indices 1990 ont 1989 comme année de base, etc. Chaque indice est exprimé en termes de 1985 comme année de référence (i.e. 1985=100) en chaînant tous les liens avant et après 1985.

1.2 Les indices en chaîne ont plusieurs propriétés intéressantes. D'abord, les pondérations utilisées pour construire l'indice sont issues de valeurs récentes et de quantités commercialisées, et réagissent donc aux changements structurels du commerce mondial.

1.3 Le second avantage des indices en chaîne est qu'ils sont plus résistants devant un événement anormal tel qu'un pic temporaire dans les prix des marchandises. Si cela se produit dans l'année de base, il peut distordre la pondération d'un indice à base fixe jusqu'à ce que la base soit modifiée.

1.4 Troisièmement, puisque la nomenclature combinée (NC) est modifiée chaque année en raison de la subdivision et du regroupement des sous-positions, on obtient des comparaisons de meilleure qualité en concentrant les changements d'une année sur l'autre. La solution de rechange est de définir, pour un large éventail de produits, des groupes de sous-positions stables sur plusieurs années.

1.5 Il est particulièrement intéressant d'obtenir de bons indicateurs de tendance à court terme, de l'avis même des utilisateurs de données du commerce extérieur. Peu démentiront dans le cas présent la supériorité des indices en chaîne. Bien que leurs avantages soient davantage controversés en tant qu'indicateurs à moyen et à long termes, de nombreux auteurs d'articles récents sur le sujet continuent de les préférer.

2. Le choix d'une formule d'indice

2.1 Les États membres utilisent diverses formules pour calculer les indices du commerce extérieur. Quatre pays utilisent une formule de Fisher pour les indices de valeur unitaire, quatre autres utilisent l'indice de Paasche et un utilise l'indice de Laspeyres. Les utilisateurs de la Commission ont exprimé leur préférence pour des indices du type Fisher. Sur le long terme, les indices en chaîne de Laspeyres et de Paasche divergent. Il n'y a aucune raison de croire que l'un donne des résultats plus "justes" que l'autre. D'un autre côté, l'indice en chaîne de Fisher, qui est une moyenne géométrique des deux, est très voisin de l'approximation Törnqvist-Theil de l'indice Divisia qui a un certain nombre de défenseurs.

2.2 Les formules traditionnelles d'indices sont utilisées pour calculer les liens entre les années ou mois et la moyenne de l'année précédente. Ce sont:

Lien pour la valeur unitaire (formule de Laspeyres):

$$(1) \quad \frac{\sum_{i=1}^n V(y-1, i) \frac{u(y, m, i)}{U(y-1, i)}}{\sum_{i=1}^n V(y-1, i)}$$

Lien pour la valeur unitaire (formule de Paasche):

$$(2) \quad \frac{\sum_{i=1}^n v(y, m, i)}{\sum_{i=1}^n v(y, m, i) \left/ \frac{u(y, m, i)}{U(y-1, i)} \right.}$$

Lien pour la valeur:

$$(3) \quad \frac{\sum_{i=1}^n v(y, m, i)}{\sum_{i=1}^n V(y-1, i)}$$

Lien pour le volume (formule de Laspeyres):

$$(4) \quad \frac{\text{Lien pour la valeur}}{\text{Lien pour la valeur unitaire de Paasche}}$$

Lien pour le volume (formule de Paasche):

$$(5) \quad \frac{\text{Lien pour la valeur}}{\text{Lien pour la valeur unitaire de Laspeyres}}$$

Lien de Fisher:

$$(6) \quad \sqrt{\text{Lien de Laspeyres} \times \text{Lien de Paasche}}$$

où:

$v(y, m, i)$ = valeur du commerce en article i pour le mois m de l'année y ;

$$V(y-1, i) = \frac{1}{12} \sum_{m=1}^{12} v(y-1, m, i);$$

$u(y, m, i)$ = valeur unitaire de l'article i pour le mois m de l'année y ;

$U(y-1, i)$ = valeur unitaire moyenne de l'article i pour l'année $y-1$, soit valeur totale divisée par quantité totale.

2.3 Les valeurs du mois courant plutôt que celles de l'ensemble de l'année courante sont utilisées comme pondération dans le lien de Paasche (2), en dépit de leur plus grande instabilité. Les raisons de ce choix sont premièrement de préserver la relation (4) et deuxièmement, parce que les poids annuels ne sont disponibles qu'après la fin de l'année courante.

3. Les sources de données

3.1 Les sources de données primaires sont les statistiques du commerce NC fournies à Eurostat par les États membres. Pour les groupes suivants de produits (définis en CTIC rev. 3), les valeurs unitaires calculées à partir des données du commerce ne fournissent pas une indication satisfaisante de l'évolution des prix:

CTCI 525: Matériaux radioactifs et associés;

CTCI 667: Perles, pierres gemmes et semi-précieuses, brutes ou travaillées;

CTCI 792: Équipements pour avions et assimilés, véhicules spatiaux (y compris satellites) et véhicules de lancement de véhicules spatiaux; et pièces détachées;

CTCI 793: Navires, bateaux (y compris overcrafts) et structures flottantes;

CTCI 883: Film cinématographique, exposé et développé, avec ou sans bande sonore, ou consistant uniquement en une bande sonore;

CTCI 896: Travaux d'art, pièces de collection et antiquités;

CTCI 897: Joaillerie, et orfèvrerie, etc.

En pratique, le ratio de valeur unitaire¹ de chacun de ces groupes est imputé du ratio de valeur unitaire d'autres produits non rejetés appartenant à la même division de la CTIC.

3.2 Les données brutes sont classées par pays, flux, code NC et pays partenaire. L'approche d'Eurostat est de travailler avec les données détaillées alors que la plupart des États membres calculent les indices après avoir agrégé les résultats par pays partenaire. Cette dernière solution présente des avantages apparents. En plus de diminuer la taille des données traitées, le nombre de discontinuités est également réduit. Le commerce avec un partenaire particulier

¹ratio de valeur unitaire : $\frac{u(y, m, i)}{U(y-1, i)}$

peut être enregistré seulement pendant un petit nombre de mois de l'année, tandis qu'avec certains autres partenaires, le commerce se fait pratiquement tous les mois. D'autre part, même un examen rapide des séries de valeurs unitaires ventilées par partenaire montre que l'hypothèse d'une valeur unitaire commune est très souvent irréaliste, parce que des marchandises identiques ont des prix différents pour différents partenaires, ou bien parce que la sous-position NC couvre plusieurs qualités ou types de produits et que différents partenaires demandent ou fournissent différentes proportions de ces produits individuels. C'est pourquoi les valeurs unitaires calculées après agrégation des partenaires peuvent varier en raison de l'instabilité de la ventilation du commerce du partenaire. Les mêmes arguments s'appliquent pour le choix entre produits agrégés et produits détaillés. Dans tous les cas, l'information sur le partenaire permet de stratifier les valeurs unitaires dans des groupes de produits plus homogènes. Pour ces raisons, les indices de valeur unitaire d'Eurostat sont calculés à partir de données originales sans agrégation des partenaires ou des produits.

3.3 Une exception à la règle de non-agrégation s'applique lorsqu'il y a une modification dans la nomenclature combinée entre deux années. Dans ce cas, les produits sont combinés pour produire un agrégat avec la même définition pour les deux années. Les modifications dans la définition géographique de pays partenaires sont beaucoup moins fréquentes et sont généralement insignifiantes. Dans ce cas, on procède à la meilleure adéquation entre couples de pays.

3.4 Pour la plupart des codes NC, il existe des informations sur la valeur, le poids et parfois, une unité de quantité supplémentaire, telle que le nombre d'articles. Dans ce cas, deux types de valeur unitaire (par tonne et par unité supplémentaire) sont disponibles. Une valeur unitaire rapportée à l'unité supplémentaire (par exemple, valeur par automobile) n'est pas nécessairement une meilleure mesure de prix que la valeur par tonne. Si plusieurs produits sont couverts par un même code NC, et si leur prix est parfaitement corrélé avec leur poids, la valeur par tonne ne sera alors pas affectée par des fluctuations dans la composition du produit. La fiabilité avec laquelle le poids est mesuré comparée avec la fiabilité d'une unité supplémentaire est aussi un facteur. Eurostat préfère utiliser la valeur moyenne par tonne car des tests indirects ont

récemment montré que le poids semble avoir été mesuré de façon plus fiable que les unités supplémentaires. Sur une période plus longue, des modifications techniques peuvent causer des biais substantiels dans les deux types de valeur unitaire.

3.5 Une des manières de traiter la confidentialité dans les données NC est d'affecter le commerce d'un produit à un code géographique spécial de manière à dissimuler l'origine ou la destination. Il existe certains produits pour lesquels ceci est un facteur important, et le pourcentage de la valeur déclarée du commerce par rapport à la valeur effective pour une zone géographique particulière (telle que extra-CE) peut fluctuer d'un mois à l'autre. Aucune tentative n'est actuellement effectuée en vue d'ajuster les indices de volume et de compenser ces fluctuations.

3.6 Les données NC enregistrent la valeur du commerce en milliers d'Écus. Tous les indices de valeur unitaire d'Eurostat sont exprimés en termes d'Écus. La conversion en autres unités monétaires est directe.

3.7 Les données NC sont également ventilées par régime statistique, de sorte que, par exemple, des marchandises importées pour transformation immédiate avant réexportation dans leur pays d'origine sont distinguées des importations normales. Seul le commerce normal (régime statistique 1) est utilisé pour calculer les indices de valeur unitaire, bien que le commerce total soit utilisé pour les indices de valeur à partir desquels sont calculés les indices de volume.

3.8 Toute erreur dans les données mensuelles n'est corrigée que plusieurs mois après. C'est pourquoi un indice annuel basé sur les douze mois agrégés contiendra également des erreurs. Cependant, il s'agit en partie de chiffres annuels corrigés. Ceux-ci sont utilisés pour calculer les liens annuels pour le volume qui sont enchaînés à l'année de base. Là où elles se produisent, les erreurs dans les données mensuelles peuvent distordre les chiffres mensuels et trimestriels en volume. Ainsi, pour les indices plus détaillés, il existe des écarts occasionnels entre la moyenne annuelle de l'indice mensuel et trimestriel en volume, et l'indice annuel.

4. Traitement des valeurs extrêmes

4.1 Les procédures administratives pour valider les données du commerce varient suivant les États membres. Depuis que la donnée mensuelle utilisée par Eurostat pour calculer les indices est la première version de ces données -et souvent des révisions importantes sont effectuées par la suite- il est malheureusement vrai que des mouvements de valeurs unitaires extrêmement importants ne sont pas chose rare. Dans un échantillon de données, on a trouvé une valeur unitaire 700 fois plus grande que celle de l'année précédente. En général, on s'attend à ce que les prix sous-jacents se modifient très peu. Ces extrêmes sont donc dus soit à des erreurs d'enregistrement soit à la non-homogénéité des données. En tout cas, une répartition très étalée des variations de valeurs unitaires peut conduire à ce que les formules d'indice habituelles fournissent des résultats peu fiables. La méthode d'Eurostat concernant l'utilisation des distributions très étalées consiste à utiliser la technique de régression décrite par Hinich et Talwar.²

4.2 La méthode repose sur l'observation que, alors que le niveau des valeurs unitaires entre pays partenaires peut différer, les variations de niveaux sont très similaires non seulement parmi les pays partenaires, mais aussi entre produits liés, compte tenu du niveau de bruit de fond dans les données de valeur unitaire. Une étude effectuée par Eurostat montre cependant des variations significatives parmi les pays déclarants (en liaison avec les fluctuations du taux de change). Eurostat a donc divisé les données brutes en 200 blocs de données pour chaque pays déclarant et chaque flux. Chaque bloc contient des données pour une série particulière de sous-positions NC et tous les pays partenaires correspondant à ces codes. L'hypothèse est que, à l'intérieur d'un bloc, chaque valeur unitaire a le même comportement.

4.3 Ainsi, la méthode consiste à accepter les articles dont la variation de valeur unitaire fluctue, à l'intérieur de certaines limites, par rapport à la variation de la valeur unitaire médiane du bloc (par exemple, plus ou moins 10%) et rejeter

provisoirement les autres. Le rejet provisoire d'un article peut être dû au fait que la valeur unitaire du mois $m-1$ est d'une qualité douteuse ou n'est pas disponible. Ces articles sont donc testés pour une seconde paire de mois. Normalement, la variation entre les mois m et $m-2$ est alors utilisée. Dans ce cas, l'article est accepté s'il passe le second test. Ces règles sont dérivées d'un modèle probabiliste simple de la fréquence de données extrêmes supérieures et inférieures. Bien qu'elles éliminent les observations fausses dans le mois courant, elles ne fournissent aucune protection contre les données aberrantes parmi les valeurs unitaires de l'année de base. Une solution serait de calculer le chiffre annuel seulement à partir de données mensuelles lorsque l'article a été accepté. Cependant, pour des raisons techniques, cela ne se fait pas actuellement. Un article est donc rejeté si le ratio de la valeur unitaire du mois courant sur celle de l'année de base sort de l'intervalle $[0,2;5]$. Cette fourchette a été fixée après examen des variations de prix typiques trouvées pour des produits saisonniers et non saisonniers, et peut être modifiée dans des circonstances exceptionnelles.

4.4 La procédure de rejet susmentionnée a la propriété d'identifier un ratio de valeur unitaire extrême comparé au mouvement général de sa classe (= bloc) d'un mois sur l'autre. Ce procédé est probablement plus satisfaisant que de fixer une fourchette arbitraire de fluctuations absolues. L'étape suivante consiste simplement à calculer les liens de Laspeyres et de Paasche pour le mois courant (en prenant l'année précédente comme année de base) en utilisant seulement les articles acceptés. Ces liens servent alors d'estimation de la variation de la valeur unitaire pour les articles dont les valeurs unitaires ont été rejetées. Les définitions des blocs sont indépendantes des indices définitifs et les données qu'elles comportent peuvent être utilisées dans plus d'un indice final. Pour chaque indice, on retient un enregistrement de la valeur mensuelle courante et de celle de l'année de base des articles à commerce non nuls qui sont acceptés par les tests susmentionnés. Les ratios de couverture de l'échantillon pondéré pour la période de base et pour la période courante sont alors calculés (i.e. pourcentage de la valeur "acceptée" par rapport à la valeur totale) et un chiffre de compromis pour la couverture de l'échantillon est trouvé en prenant la moyenne géométrique.

4.5 Les liens pour la valeur sont calculés en utilisant tous les articles et pas seulement les articles

²M.J. Hinich, P.P. Talwar : "A simple method for robust regression", Journal of the American Statistical Association, Mars 1975.

acceptés. Dans cette hypothèse implicite, les valeurs unitaires douteuses sont dues à des erreurs de quantité seulement. En moyenne, ce sont 11% en valeur courante des articles qui sont rejetés (soit un taux de couverture de 89%). Dans la présente publication, les tableaux indiquent des éléments avec un astérisque lorsque la couverture de l'échantillon se situe entre 25 et 50%. Les articles avec une couverture d'échantillon inférieure à 25% ne sont pas présentés.

4.6 On a constaté que le fait d'exclure des articles ayant une petite valeur de commerce pour l'année précédente n'a virtuellement aucun impact sur les liens d'indice qui sont pondérés en valeur. Cependant, au niveau informatique, cela représente une économie de travail considérable étant donné que ce type d'articles est très répandu. Actuellement, les articles ayant une valeur pour l'année de base inférieure au seuil de 1% de la valeur pour l'année de base de son bloc avec un maximum de 100.000 Écus, ne sont pas pris en considération pour le calcul des indices de valeur unitaire. Il en résulte une exclusion moyenne de 3% de la valeur totale du commerce, mais de plus de 70% en nombre de tous les articles.

5. Calcul des liens pour les indices mensuels

5.1 Au début de chaque année, les codes NC pour l'année précédente et l'année courante correspondent à des blocs et à des indices. Les données annuelles cumulatives pour l'année précédente sont traitées en retenant les articles définis par le flux/produit/partenaire qui se trouve au-dessus du seuil pour chaque bloc. Les modifications dans la nomenclature combinée sont insérées en créant des agrégats de produits avec les mêmes constituants pour les deux années. Il existe aussi un petit nombre de codes NC saisonniers qui sont combinés pour fournir un agrégat de produits qui couvre toute l'année.

5.2 Chaque mois, la donnée NC mensuelle "isolée" pour les articles retenus est traitée, bloc par bloc, pour donner les numérateurs Laspeyres et Paasche et les dénominateurs pour tous les indices primaires qui sont demandés. Cette information est stockée, et utilisée à un autre stade du traitement pour produire des liens d'indice à un niveau supérieur du produit ou de la zone d'agrégation. En outre, une information

sur le prix extérieur peut être combinée avec les indices de valeur unitaire à ce stade.

5.3 Des séries d'indice sont calculées pour plusieurs nomenclatures de produits. Des niveaux supérieurs de classe de produits (par exemple, section CTCI à un chiffre) sont calculés par agrégation des numérateurs et des dénominateurs des indices constitutifs. Parfois, un indice constitutif pour un petit pays manque pour un mois. Soit son commerce est nul, soit son taux de couverture est jugé trop faible pour fournir un indice de valeur unitaire fiable. On a estimé qu'il n'était pas satisfaisant de calculer l'indice de niveau supérieur en agrégeant simplement les indices constitutifs qui se trouvent être disponibles, car si l'indice manquant a un poids important et un niveau différent des autres, l'indice agrégé fluctuera à chaque entrée ou sortie de cet indice. La solution d'Eurostat consiste à estimer le niveau de l'indice de valeur unitaire manquant, et (dans le cas de commerce nul), le poids de l'indice pour l'indice Paasche.

5.4 Les indices de la Communauté Européenne en tant que déclarant sont calculés en combinant les indices de pays. La valeur unitaire de Laspeyres et les liens en volume pour la CE sont calculés en pondérant les liens de Laspeyres pour chaque pays déclarant individuellement par la valeur du commerce de l'année précédente (avant élimination des produits se trouvant au-dessous du seuil). Un lien de valeur communautaire est calculé en combinant les liens de valeur pour les déclarants individuels ayant les mêmes poids. Les liens de Paasche pour la CE sont calculés par division.

5.5 Les données NC ne sont généralement pas disponibles pour les nouveaux États membres concernant les années précédant leur adhésion. C'est pourquoi, l'indice CE est calculé sans la Grèce en tant que pays déclarant jusqu'en décembre 1981 et porte sur la Communauté sans l'Espagne et le Portugal jusqu'en décembre 1985. Ainsi, l'indice 1986 est calculé en raccordant la variation pour EUR12 entre 1985 et 1986 au niveau 1985 pour l'indice EUR10.

6. Le chaînage des liens

6.1 Les liens mensuels en volume de Laspeyres et de Paasche fournissent un indice de volume pour le mois courant par rapport à la moyenne de la donnée

(isolée) de l'année précédente. La valeur unitaire trimestrielle et les liens de volume sont calculés en additionnant les liens mensuels pour le trimestre et en divisant par trois. Les liens annuels de valeur unitaire sont calculés en additionnant les liens trimestriels et en divisant par quatre. Le lien annuel de valeur utilisé pour calculer l'indice de volume, est calculé à partir des données annuelles révisées (cumulatives), plutôt qu'à partir des valeurs mensuelles originales. Cela peut être la cause de différences plus ou moins importantes dans l'indice de valeur mensuelle implicite! Le chaînage des liens est la cause de ce phénomène. Ainsi, les liens de valeur unitaire trimestriels et annuels sont effectivement des moyennes des liens de valeur unitaire mensuels pondérés par des liens de volume mensuels. Cette méthode est utilisée, plutôt que la simple moyenne des liens de valeur unitaire mensuels, pour préserver la relation

$$\text{volume} \times \text{variation de valeur unitaire} = \text{variation de valeur}$$

pour toutes les périodicités. Les indices annuels ainsi obtenus peuvent différer de ceux qui seraient calculés à partir de données annuelles directement, partiellement à cause de l'élimination de valeurs unitaires extrêmes au niveau mensuel.

6.2 Lorsque les liens annuels ont été calculés, les indices sont chaînés en aval et en amont de l'année de référence (1985 pour le moment).

Exemple du chaînage d'un indice pour le mois m de l'année y (où y est supérieur à 1985):

$$\begin{aligned} &100 \times (\text{lien annuel pour 1986, base 1985}) \\ &\quad \times (\text{lien annuel pour 1987, base 1986}) \\ &\quad \times \dots\dots\dots \\ &\quad \times (\text{lien annuel pour l'année } y-1, \text{ base } y-2) \\ &\quad \times (\text{lien mensuel pour le mois } m, \text{ année } y, \\ &\quad \quad \text{base } y-1) \end{aligned}$$

Symboles and abbréviations utilisés

GCE	Grandes catégories économiques
NACE CLIO	Nomenclature des activités dans les Communautés européennes pour l'établissement des tableaux entrées-sorties
CTCI	Classification type du commerce international, révision 2
:	Non disponible
*	Indice à faible taux de couverture (< 50 %)
n.c.a.	Non classé ailleurs
n.d.a.	Non désigné ailleurs
VAL	Indice de valeur (exprimé en ECU)
VOL	Indice de volume
UV	Indice de valeur unitaire (exprimé en ECU)
$\Delta\%$	Pourcentage de variation par rapport à la période correspondante de l'année précédente
W	Pourcentage du produit dans le commerce total sans les articles non classés ailleurs, pour l'année 1991
