Eurostat hat die Aufgabe, den Informationsbedarf der Kommission und aller am Aufbau des Binnenmarktes Beteiligten mit Hilfe des europäischen statistischen Systems zu decken.

Um der Öffentlichkeit die große Menge an verfügbaren Daten zugänglich zu machen und Benutzern die Orientierung zu erleichtern, werden zwei Arten von Publikationen angeboten: Statistische Dokumente und Veröffentlichungen.

Statistische Dokumente sind für den Fachmann konzipiert und enthalten das ausführliche Datenmaterial: Bezugsdaten, bei denen die Konzepte allgemein bekannt, standardisiert und wissenschaftlich fundiert sind. Diese Daten werden in einer sehr tiefen Gliederung dargeboten. Die Statistischen Dokumente wenden sich an Fachleute, die in der Lage sind, selbständig die benötigten Daten aus der Fülle des dargebotenen Materials auszuwählen. Diese Daten sind in gedruckter Form und/oder auf Diskette, Magnetband, CD-ROM verfügbar. Statistische Dokumente unterscheiden sich auch optisch von anderen Veröffentlichungen durch den mit einer stilisierten Graphik versehenen weißen Einband.

Veröffentlichungen wenden sich an eine ganz bestimmte Zielgruppe, wie zum Beispiel an den Bildungsbereich oder an Entscheidungsträger in Politik und Verwaltung. Sie enthalten ausgewählte und auf die Bedürfnisse einer Zielgruppe abgestellte und kommentierte Informationen. Eurostat übernimmt hier also eine Art Beraterrolle.

Für einen breiteren Benutzerkreis gibt Eurostat Jahrbücher und periodische Veröffentlichungen heraus. Diese enthalten statistische Ergebnisse für eine erste Analyse sowie Hinweise auf weiteres Datenmaterial für vertiefende Untersuchungen. Diese Veröffentlichungen werden in gedruckter Form und in Datenbanken angeboten, die in Menütechnik zugänglich sind.

Um Benutzern die Datensuche zu erleichtern, hat Eurostat Themenkreise, d. h. eine Untergliederung nach Sachgebieten, eingeführt. Daneben sind sowohl die Statistischen Dokumente als auch die Veröffentlichungen in bestimmte Reihen, wie zum Beispiel „Jahrbücher“, „Konjunktur“, „Methoden“, untergliedert, um den Zugriff auf die statistischen Informationen zu erleichtern.

Y. Franchet
Generaldirektor

It is Eurostat's responsibility to use the European statistical system to meet the requirements of the Commission and all parties involved in the development of the single market.

To ensure that the vast quantity of accessible data is made widely available, and to help each user make proper use of this information, Eurostat has set up two main categories of document: statistical documents and publications.

The statistical document is aimed at specialists and provides the most complete sets of data: reference data where the methodology is well-established, standardized, uniform and scientific. These data are presented in great detail. The statistical document is intended for experts who are capable of using their own means to seek out what they require. The information is provided on paper and/or on diskette, magnetic tape, CD-ROM. The white cover sheet bears a stylized motif which distinguishes the statistical document from other publications.

The publications proper tend to be compiled for a well-defined and targeted public, such as educational circles or political and administrative decision-makers. The information in these documents is selected, sorted and annotated to suit the target public. In this instance, therefore, Eurostat works in an advisory capacity.

Where the readership is wider and less well-defined, Eurostat provides the information required for an initial analysis, such as yearbooks and periodicals which contain data permitting more in-depth studies. These publications are available on paper or in videotext databases.

To help the user focus his research, Eurostat has created 'themes', i.e. subject classifications. The statistical documents and publications are listed by series: e.g. yearbooks, short-term trends or methodology in order to facilitate access to the statistical data.

Y. Franchet
Director-General

Pour établir, évaluer ou apprécier les différentes politiques communautaires, la Commission européenne a besoin d'informations.

Eurostat a pour mission, à travers le système statistique européen, de répondre aux besoins de la Commission et de l'ensemble des personnes impliquées dans le développement du marché unique.

Pour mettre à la disposition de tous l'importante quantité de données accessibles et faire en sorte que chacun puisse s'orienter correctement dans cet ensemble, deux grandes catégories de documents ont été créées: les documents statistiques et les publications.

Le document statistique s'adresse aux spécialistes. Il fournit les données les plus complètes: données de référence où la méthodologie est bien connue, standardisée, normalisée et scientifique. Ces données sont présentées à un niveau très détaillé. Le document statistique est destiné aux experts capables de rechercher, par leurs propres moyens, les données requises. Les informations sont alors disponibles sur papier et/ou sur disquette, bande magnétique, CD-ROM. La couverture blanche ornée d'un graphisme stylisé démarque le document statistique des autres publications.

Les publications proprement dites peuvent, elles, être réalisées pour un public bien déterminé, ciblé, par exemple l'enseignement ou les décideurs politiques ou administratifs. Des informations sélectionnées, triées et commentées en fonction de ce public lui sont apportées. Eurostat joue, dès lors, le rôle de conseiller.

Dans le cas d'un public plus large, moins défini, Eurostat procure des éléments nécessaires à une première analyse, les annuaires et les périodiques, dans lesquels figurent les renseignements adéquats pour approfondir l'étude. Ces publications sont présentées sur papier ou dans des banques de données de type videotex.

Pour aider l'utilisateur à s'orienter dans ses recherches, Eurostat a créé les thèmes, c'est-à-dire une classification par sujet. Les documents statistiques et les publications sont répertoriés par série — par exemple, annuaire, conjoncture, méthodologie — afin de faciliter l'accès aux informations statistiques.

I. NOTICE

1. FOREWORD

The creation of a truly global system of markets and production is reflected by statistical evidence. FDI stocks world-wide have risen from USD 68 billion in 1960 to 1650 billion in 1993. FDI has grown faster than GDP and trade by a factor of four and three respectively. The number of Multinational Enterprises (MNEs) has increased from around 7,000 in the late 1960s to 37,000 in the early 1990s. As a result of these developments, the sales of foreign affiliates have surpassed exports as the principal vehicle to deliver goods and services. Some estimates even put the value of goods and services sold by foreign affiliates even as almost twice as high as that of world export. This alone makes FDI one of the most important mechanisms of international economic integration. The spectacular growth in FDI has probably complemented and created trade, not substituted it.

The surge of global Foreign Direct Investment (FDI) since the beginning of the 1980s has transformed the old text-book model of trade, in which manufacturers made all their goods in one country and shipped them abroad. In their modern production strategies, firms ship components from all over the world to their world-wide network assembly plants. In services, entering a foreign market more often than not comprises commercial presence in the market by setting up a subsidiary abroad.

Foreign Direct Investment has become an essential element in today's complex corporate investment and production strategies. The development of global instantaneous communication and data transfer has resulted in the creation of a near global market place. Modern economic operators are involved in a continuous process identifying shifting comparative advantages which today stem from such factors as knowledge base, innovation capacity and the quality of human capital. The world-wide trend towards deregulation and privatisation has given a further boost to this phenomenon. Foreign Direct Investment today takes many forms. Besides the traditional green field investments or take-overs, modern operators resort more and more to forms of business co-operation. e.g. in joint ventures, strategic alliances or pooling of research and development resources.

These developments underline that the general attitude towards FDI has changed. While in the seventies, the debate was largely dominated by the concern that globally operating MNEs would interfere with the independent development of the states, today it is now almost generally accepted that FDI is a beneficial phenomenon - not only for the host - but also for the source country and will contribute to securing our energy supplies among other things.

As positive effects for the economy, the OECD lists the injection of extra investment capital into the economy, the contribution towards a healthy external balance,

increased productivity, additional employment, stimulation of competition and rationalisation of the production as well as significant transfer of technical and managerial know-how. Recognising this, developing countries have given up much of their restrictive attitude against the inflow of FDI. They are often willing to allow free transfers without restrictions for balance of payments reasons, have proven to accept global disciplines on trade distorting investment matters in the Uruguay Round and are even generally starting to compete for investment from abroad. Since the dramatic change in East-West relations it has become more evident that foreign investment is a scarce resource which no one can afford penalising.

Outward FDI is sometimes still perceived as associated with jobs losses ('delocalisation'). However, empirical studies have not come to a uniform conclusion on the impact of outward FDI on employment. The assumption of overall positive employment effects is based on the fact that all investment, including outward FDI, generates secondary flows such as exports of machinery and other capital goods, demand for manufactured production inputs or provision of know-how, which are usually provided by the source country. This creates jobs in secondary sectors often higher qualified and paid than those that might have been lost. In addition, investment abroad will generate inward flows of profits and dividends which, in turn, increase incomes and hence demand in the source country. Again this has beneficial effects on overall growth and employment levels. To these can be added the longer term development effects of FDI on the host economy which, in time, expand the local market and create demand for imports, which will in part at least, be met by producers in the country from which the investments originated. The discussion on the employment effects of outward FDI should also take into account the motivation to invest abroad. Studies show that investments by multinational companies are host-market driven, either to buy into a market or to improve servicing the market. In general, access to 'cheap labour' does not play an overriding role to invest abroad.

What is Direct Investment

In principle a firm that wishes to sell overseas has a variety of modes which it can employ. Export, license, agents are some examples, with straightforward exporting as up till now the most common mode. Direct investment is an alternative which amounts to producing directly in the country one wishes to serve. Foreign Direct Investment are investments made for the purpose of obtaining ownership and control over companies abroad. The investor's purpose is to have an effective voice in the management of the enterprise. If the formal definition of direct investment is well accepted world-wide, opinions differ substantially when it comes down

to statistical or economical analysis. Depending on whom you speak with, FDI is variously and inconsistently portrayed as:

- An alternative to or a follower of trade.
- A welcome new source of jobs for depressed regions
- A balance of payments flow that finances one country's current account deficit and recycles another country's surplus
- FDI extends the boundaries of international competition beyond what would happen with trade alone
- An insidious way for foreigners to buy into a country's productive assets
- A tool of global companies to gain strategic advantage by shifting low-paid jobs abroad while keeping high value-added research at home
- A vehicle for technology transfer - for example, few people would consider mass production techniques as an American phenomenon, and yet in an earlier era American firms brought mass production to Europe through their investments
- An alternative to debt finance for developing countries

In the most common interpretation of direct investment, it is closely linked with trade, in fact, it is often referred to as the twin of trade. Both enable firms in one country to reach markets, for inputs or outputs, in another. It is also clear that the impact of direct investment is not merely confined to the direct effect on the balance of payments. There may also be trade displacement or enhancement effects, as well as less direct influences on efficiency and productivity, industrial structure and competition.

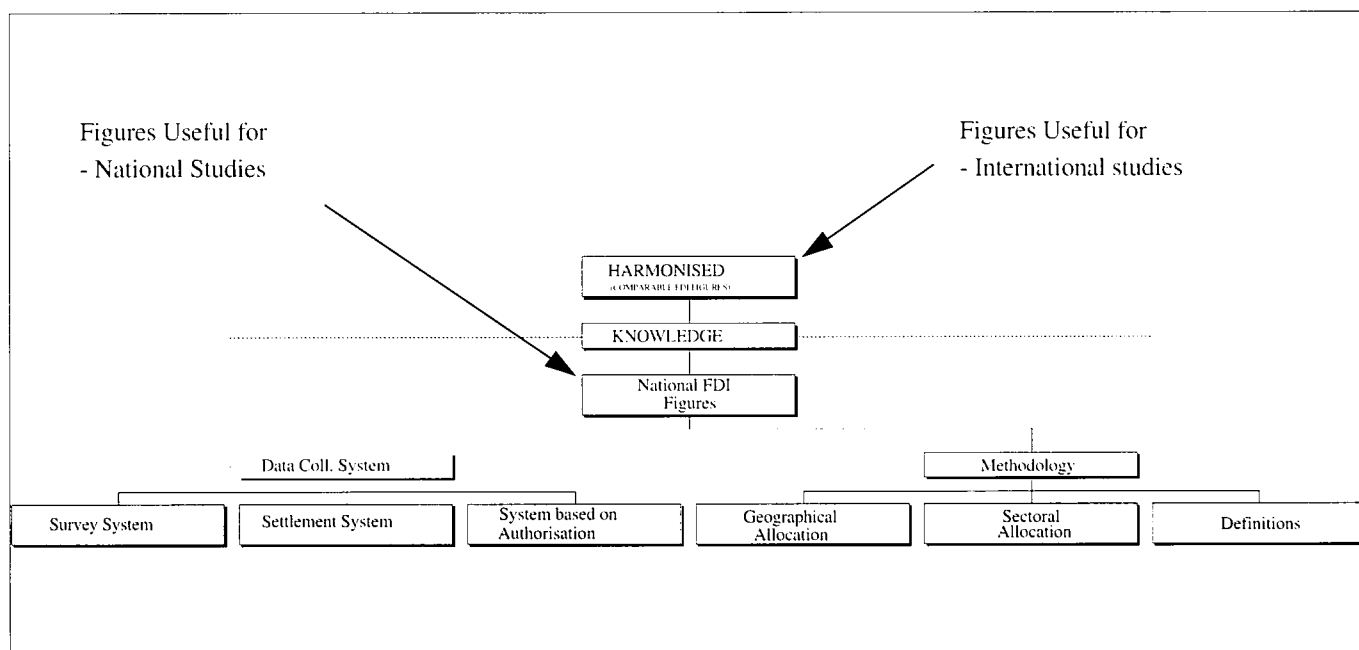

Direct Investment in this publication

The surge of FDI since the beginning of the 1980s has attracted much attention on FDI statistics. At the same time one of the modes of delivery considered in the GATS agreement is through commercial presence which usually takes the form of FDI. The need for internationally comparable figures of good quality is therefore stronger than ever. Unfortunately national FDI statistics differ in several ways hence the difficulties when comparing them. In close co-operation with its Member States Eurostat attempts with this publication at compiling coherent European Union and Member States FDI statistical series, removing national discrepancies. US and Japan FDI statistics have also been harmonised in the Eurostat framework. The final objective is to produce a set of comparable FDI data for the major world players: US, Japan, the EU and its MS. This work of harmonisation is the reason why Eurostat figures differ from national or international sources.

The graph below shows the main causes of divergence between national statistics and why harmonised FDI series are preferable for international studies.

The figures in this publication represent an analytical tool to answer questions about the dynamic evolution of direct investment over time, concerning different activity sectors, countries or economic zones. The following questions are examples of the subjects this publication can help to investigate:

- Who are the main investors?
- Direct investment - who is getting it?
- Which sectors are currently most attractive?
- Do European enterprises invest more amongst each other than in external markets?

2. An investment overview

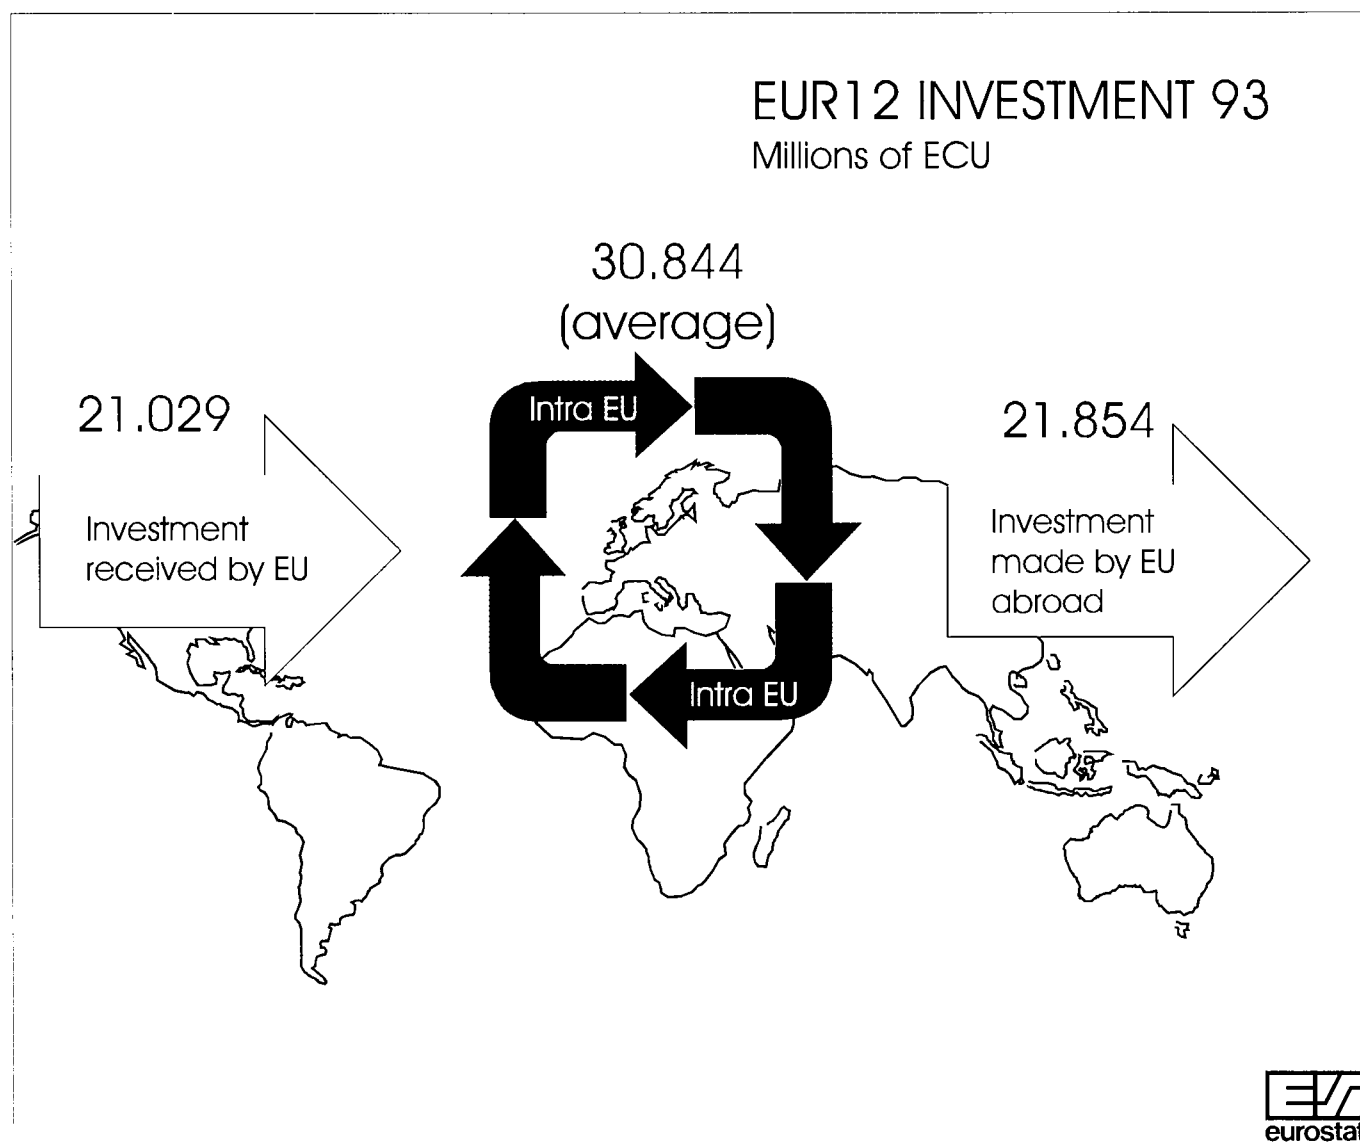

Trends in Foreign Direct Investment, FDI, are over time clearly cyclical, and in recent years a rapid growth in foreign direct investment has been observed, due to a globalisation of markets. It is estimated that world-wide flows nearly increased by a factor of 5 between 1984 and 1990, and then decreased by 36 % in 1991. The European Union, US, and Japan are the main players on the world scene and they are often referred to as the Triad.

This part highlights first, FDI flows made in 1993, and thereafter the long term trends of investments between 1984 and 1993, are analysed. The analysis is restricted to Equity and Other Capital (Total Capital flows minus reinvested earnings), and all references to EU are referring to EUR12. A detailed description of the geographical and economical zones (e.g. NICs1) can be found in the annexes.

2.1. Investment and the EUR12, 1993

In 1993, the EU market attracted more than 21 billion ecus from foreign investors, a small decrease (6.5%) compared to 1992. The EU is not only one of the most attractive destinations for FDI, it is also one of the most important sources of Foreign Direct Investment, supplying about 22 billion ecus of the world-wide outward FDI in 1993, bringing the flows back from 1992's big drop (17.7 billion). In other words, the European Union has a reasonably balanced situation in relation to in- and out-flows, for 1993.

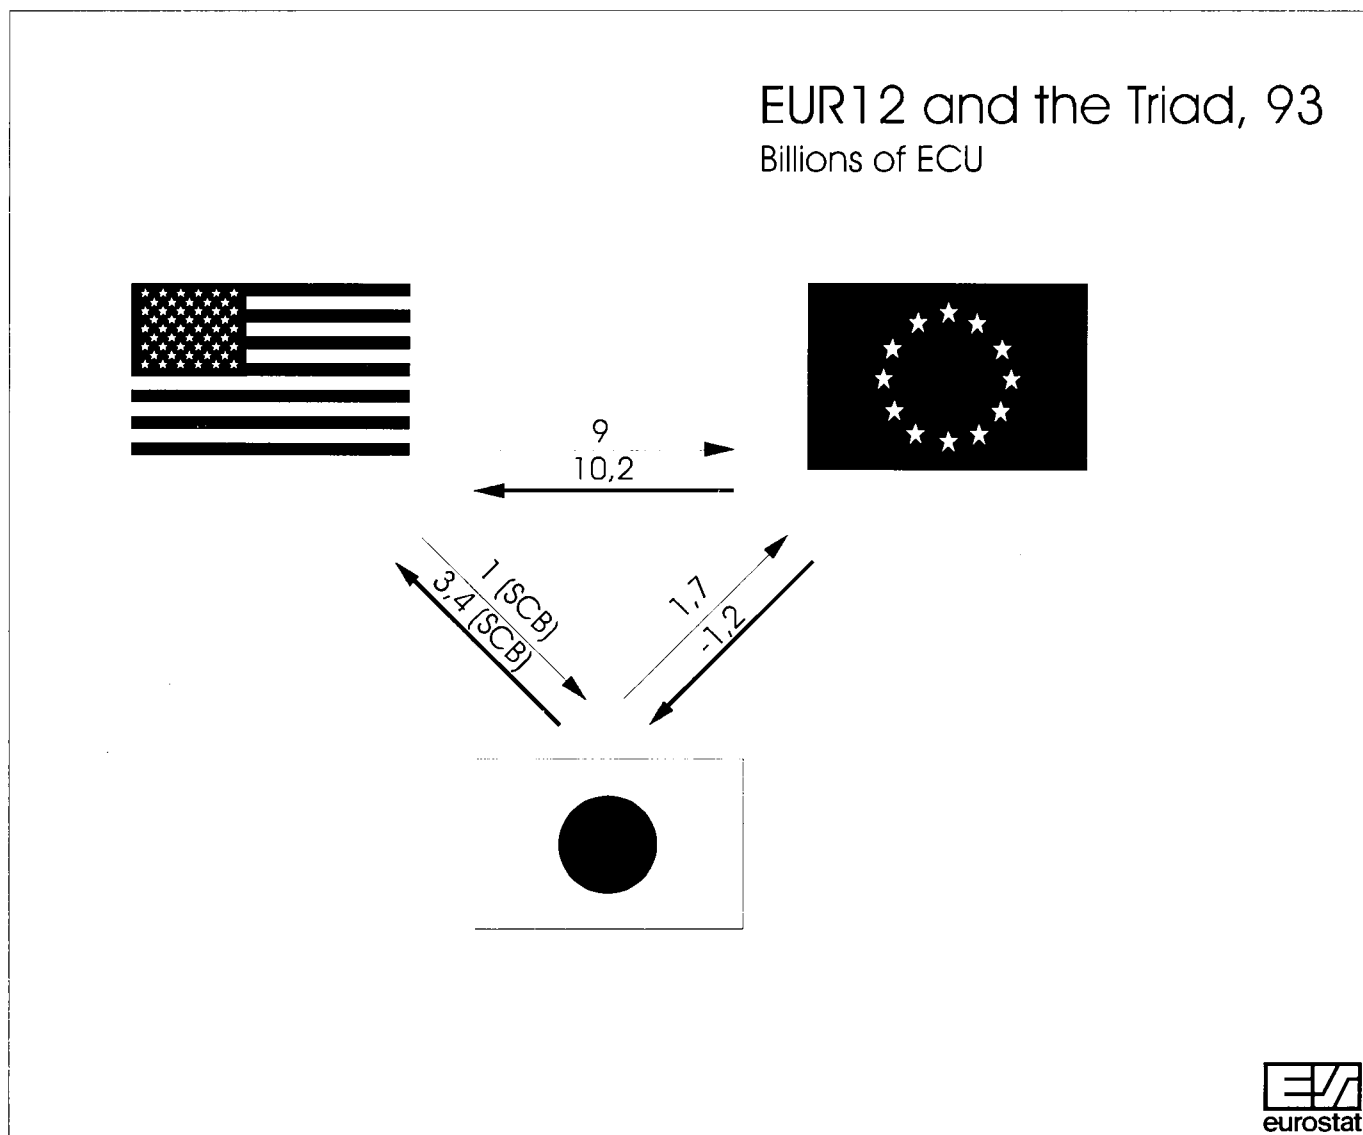

Average intra EUR12 flows are stabilising at a high level of almost 31 billion ecus, keeping the intra flows bigger than the EUR12 transactions vis-à-vis the rest of the world. This confirms previous observations, ranking intra FDI flows higher than the EU flows to and from the rest of the world.

The figure above shows the 1993 FDI flows, to, from and within the EU.

The figure below shows the investment high-ways connecting the members of the Triad, in 1993. Once again, the strong, mutual links between the US and the EU are confirmed, with the EU investing 10.2 billion ecus in the

US and the US investing 9 billion ecus in the EU. As usual Japan has an imbalance with its Triad partners, supplying much more than it is receiving.

The illustration above shows EU participation in FDI flows within the Triad, 1993 (Source Eurostat and SCB)

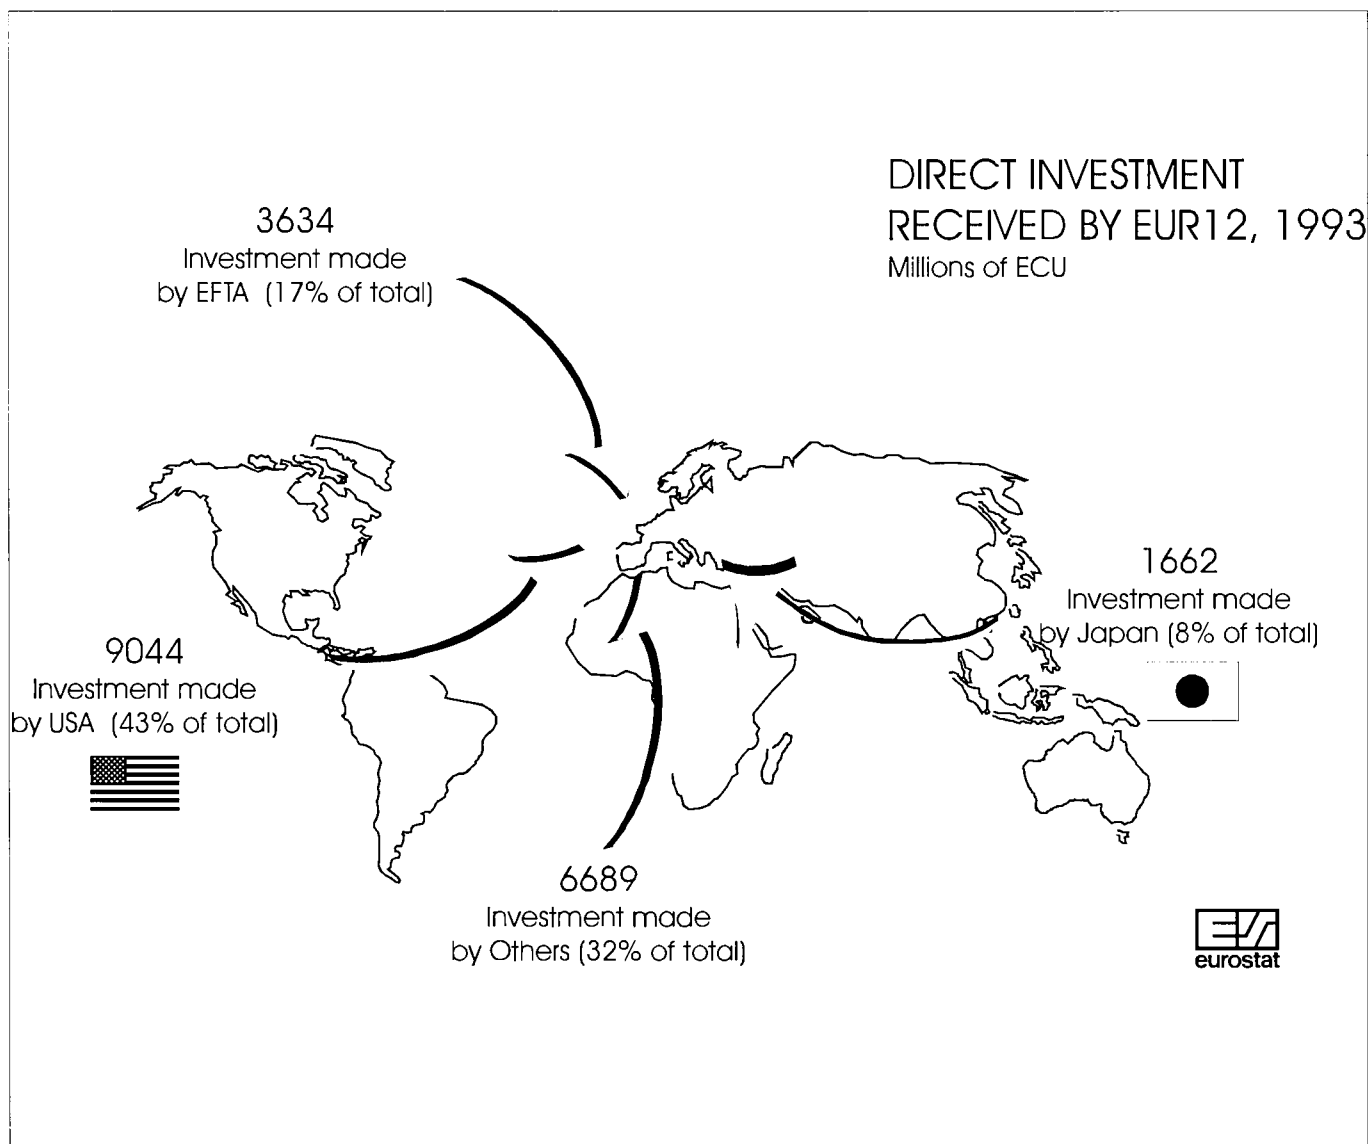

Barely beating the EU, as the biggest investor, were US enterprises with 24.2 billion in outward FDI, (against 20.4 billion in 1992, Survey of Current Business). Japan invested 11.7 billion ecus abroad, which is a reduction compared to 1992 (13 billion, Bank of Japan). The US market seems also to have improved its attractiveness to foreign investors, receiving 26.3 billion ecus in 1993

corresponding to only 16.6 billion in 1992 (SCB). This leaves the US as the main host of direct investment capital, exceeding last year's result by almost 60%. The Bank of Japan confirms strong imbalances in Japanese flows, with 11.7 billion ecus invested abroad and investments in Japan close to zero, again confirming Japan as a closed market and a source of investment capital.

2.1.1. Main investors in the EUR12, 1993

In 1993, the EU received 21 billion ecus from foreign investors. The main investors in the EU are the US, EFTA and Japan. US investment accounts for 43% (51.5% in 1992), which makes US the biggest investor in 1993.

The EFTA contribution totals 17%, leaving the EFTA countries as the second largest investor. Dominating the EFTA contribution is Switzerland, with flows almost reaching 7% of the total EU inflows. This leaves Switzerland close to becoming the third, single largest investor in the EU.

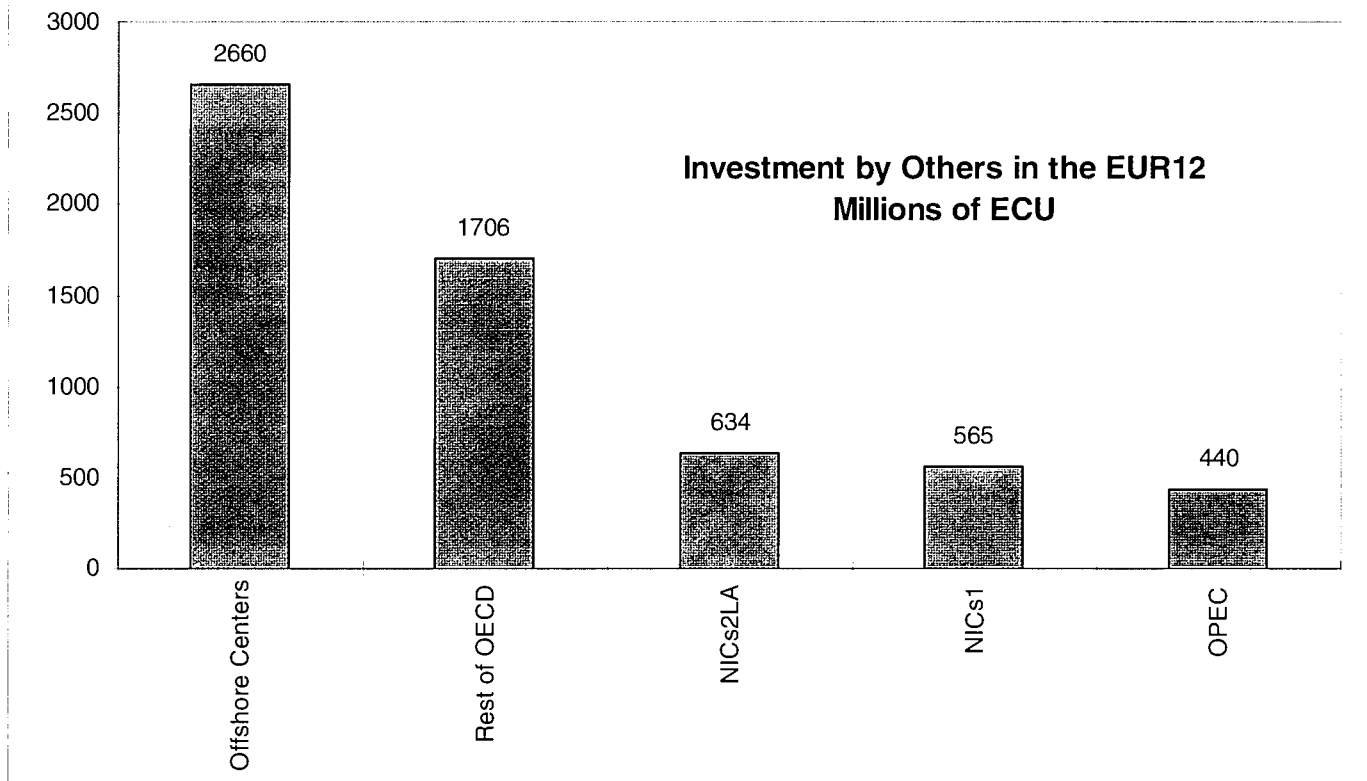

The illustration above shows the main contributors to the EU inflows.

However, Japan is still the third largest investor in the EU, but the share of Japanese investments are stabilising at 8% (1991-1993) of the EU inflows. These three

investors together accounted for 68% of the total investment in the EU, leaving other investors at 32%.

EU investments from Others are becoming increasingly important, and supplied 6.8 billion EU inward investments. Behind these figures offshore centres are playing a main role, contributing 12.6% of the EU inflows in 1993

(6% in 1992). The rest of the OECD countries, mainly Canada, Australia, and New Zealand, provided 8% of the EU inflows (5% in 1992).

The graph above shows investment made by Others in the EU (Millions of ECU), 1992

NICs1 and NiCs2LA together supplied 1.2 billions or almost 6% of the EU inflows, in 1993. This is a large increase compared to 1992 and a significant change in behaviour, as these countries used to be merely hosts

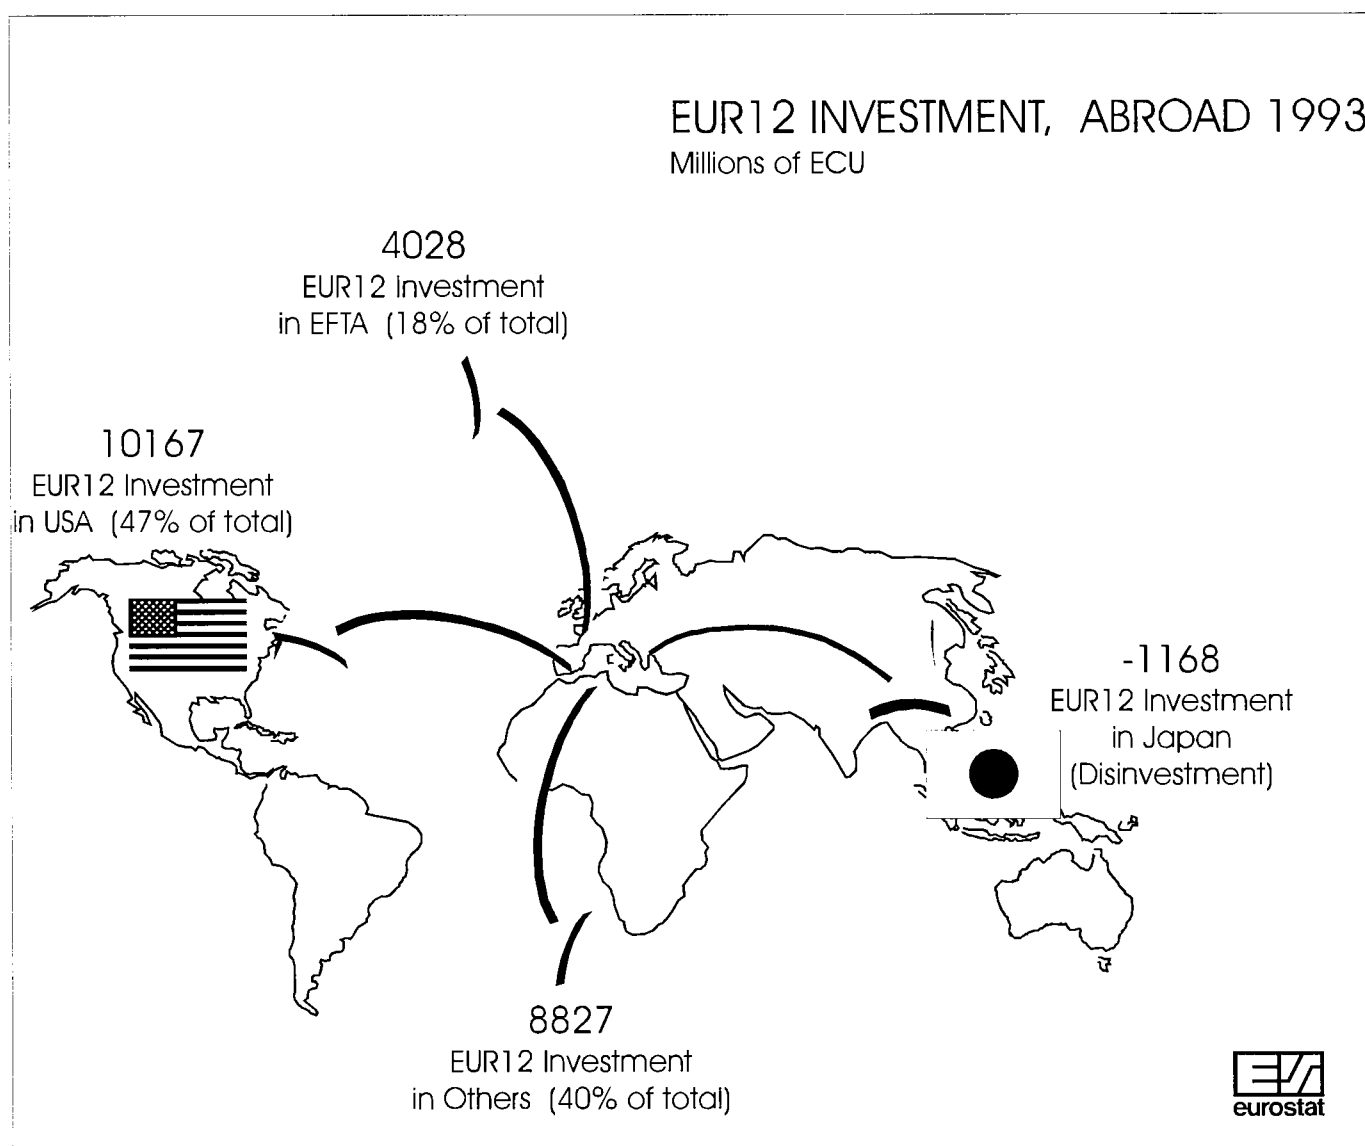

for FDI capital. Now, these countries are net exporters of direct investment capital with the European Union, which means that they invest more in the EU than vice versa.

2.1.2. Main receivers of EU direct investment, 1993

In 1993, the EU invested about 22 billion abroad. The US is the main, single target for EU investment receiving more than 47% in 1993 (37% in 1992). This is an increase compared to 1990, 1991 and 1992, but it is still far from the high level reached in the 1980s. In 1993, 62% of FDI made in the US was supplied by the EU which is five times the investments received from Japanese enterprises. The second biggest receiver of EU investments are the EFTA countries, hosting more than

18% in 1993 and 15% in 1992. The EFTA members Sweden and Switzerland are after the US, the main single receivers, hosting 1.4 billion of EU investments.

Japan has a long history as a closed market, with very low inward investment. In 1993 the situation remains unchanged, with EU investors even disinvesting in Japan, withdrawing 1.2 billion from the Japanese market. This confirms that despite recent Japanese efforts to attract foreign investments, Japan remains a marginal market for EUR12 and US investors.

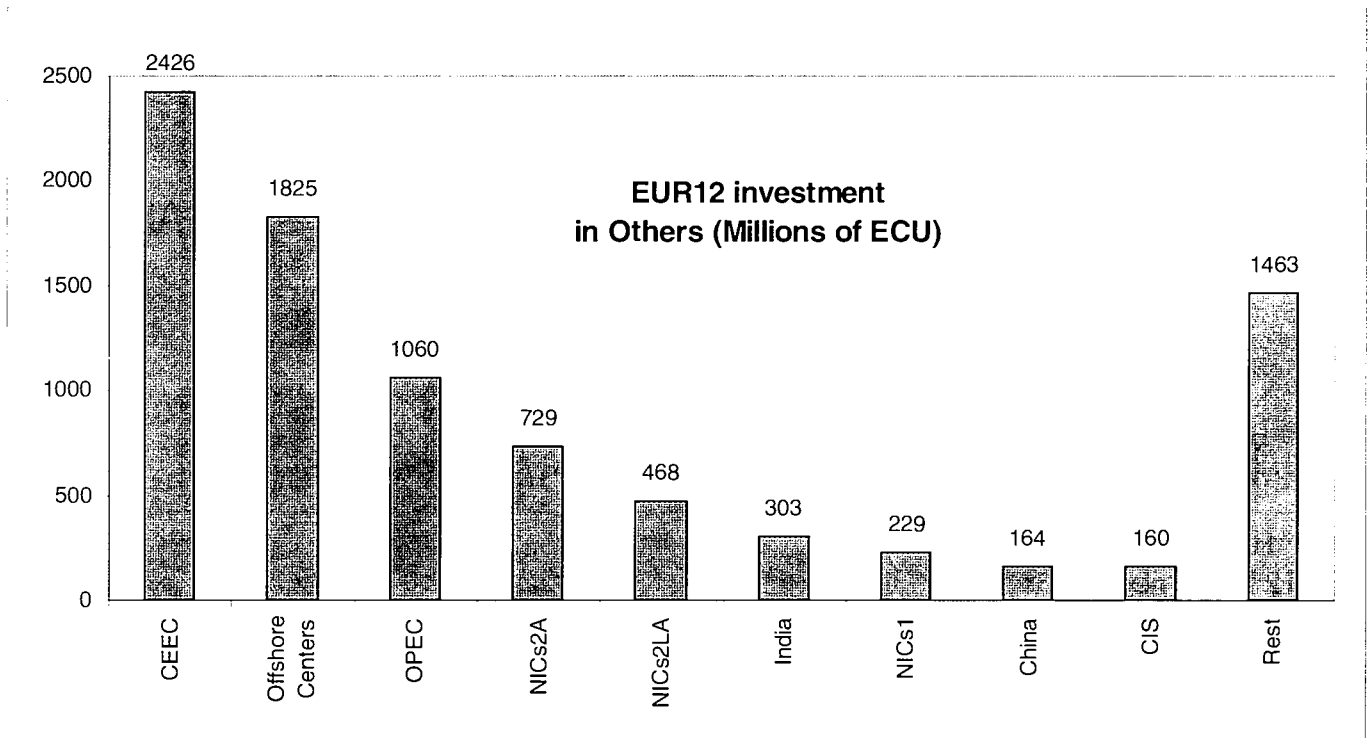

The illustration above shows the main receivers of EU outflows.

EU investments in Other areas are becoming more important, and attracted 8.8 billion or 40% of the EU flows.

In particular, EU investments increased in the direction of its neighbours to the East, with the CEEC and CIS countries experiencing varying fortunes. CEEC countries are increasing their attractiveness to EU investors, with 11.1% of the EU outflows in 1993 and 9.8% in 1992. In fact, the CEEC are closing up to the level of investment, received by EFTA countries.

EU investors seem to dominate this market, with US investments effort estimated, by Eurostat, at less than 4% of the US investment abroad in 1993 (and less than 3% in 1992). The amount of Japanese investments seems to be negligible in the CEEC countries, for both 1993 and 1992.

The CIS countries are apparently remaining on the sidelines and the investment efforts made by the EU, US and Japan towards this zone are either negligible or estimated close to zero.

The graph above illustrates EUR12 investment made in Others.

In the Asian market the NICs1, NICs2 and China received only 5% of total EU investments abroad in 1993 (6.5% in 1992), US as well directed to this area only 5.6% of total investments in 1993 (3.9% in 1992) while Japan confirmed its high share of investment in these countries with 12.5% in 1993 against 11% in 1992. It is also worth stressing that also Japan directs a much larger share of its investments to this area, nevertheless the amount, in absolute terms, of investments of the US, Japan and the EU remains comparable in 1993.

Unfortunately the offshore centres continue to play a significant role, drawing a biased picture of the real destination of FDI flows: 8.4% of EU flows abroad have been declared towards offshore centres in 1993, and it is not possible to distinguish whether these flows are in transit towards other destinations, or if they remain as holdings.

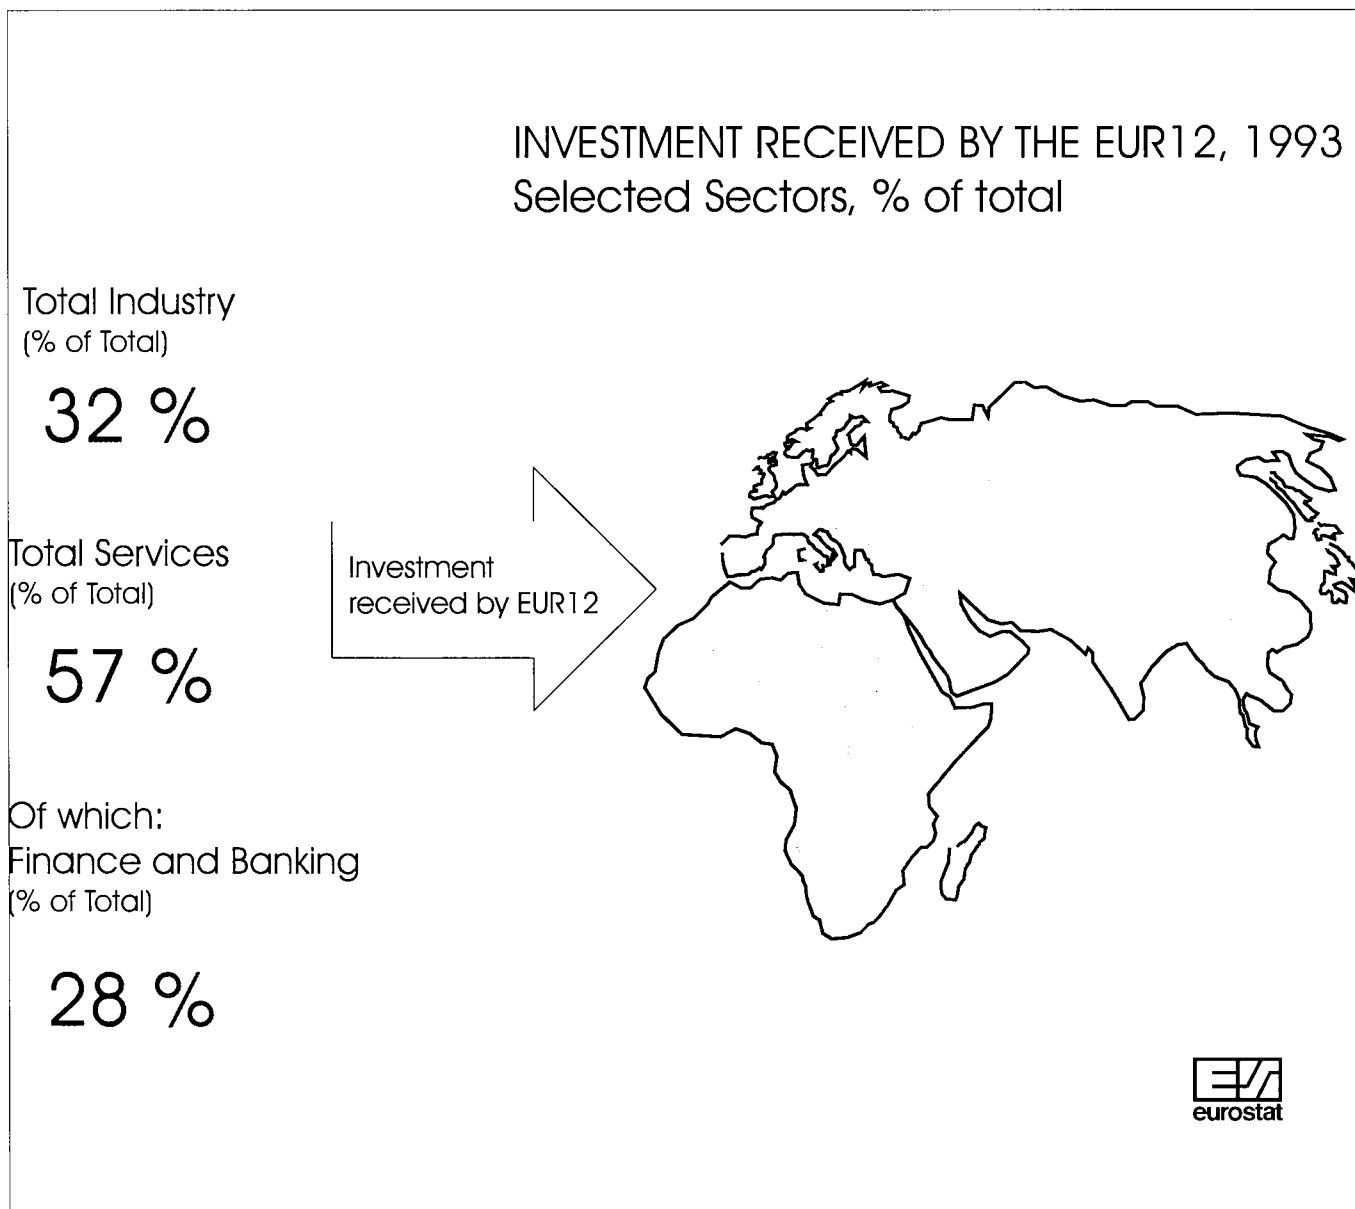

All together, this strengthens the idea that besides the traditional investment highways connecting the Triad countries, investors are more likely to take the small roads and invest in their neighbourhood.

2.1.3. The most interesting sectors, 1993

Deregulation and privatisation, beginning in the mid-1970s in the US, the early 1980s in the UK and mid-1980s elsewhere in Europe and Japan, are opening large and previously protected industries to international competition. Given the nature of most services, exchange of which often requires direct contact between the buyer and seller, it is not surprising that international competition often takes the form of FDI rather than of trade.

A retailer or hotelier, for example, mainly diversify internationally through FDI. This fact together with the structural change in advanced economies, moving the countries from agriculture, to industry and thereafter services, leaves the service sector with the biggest potential.

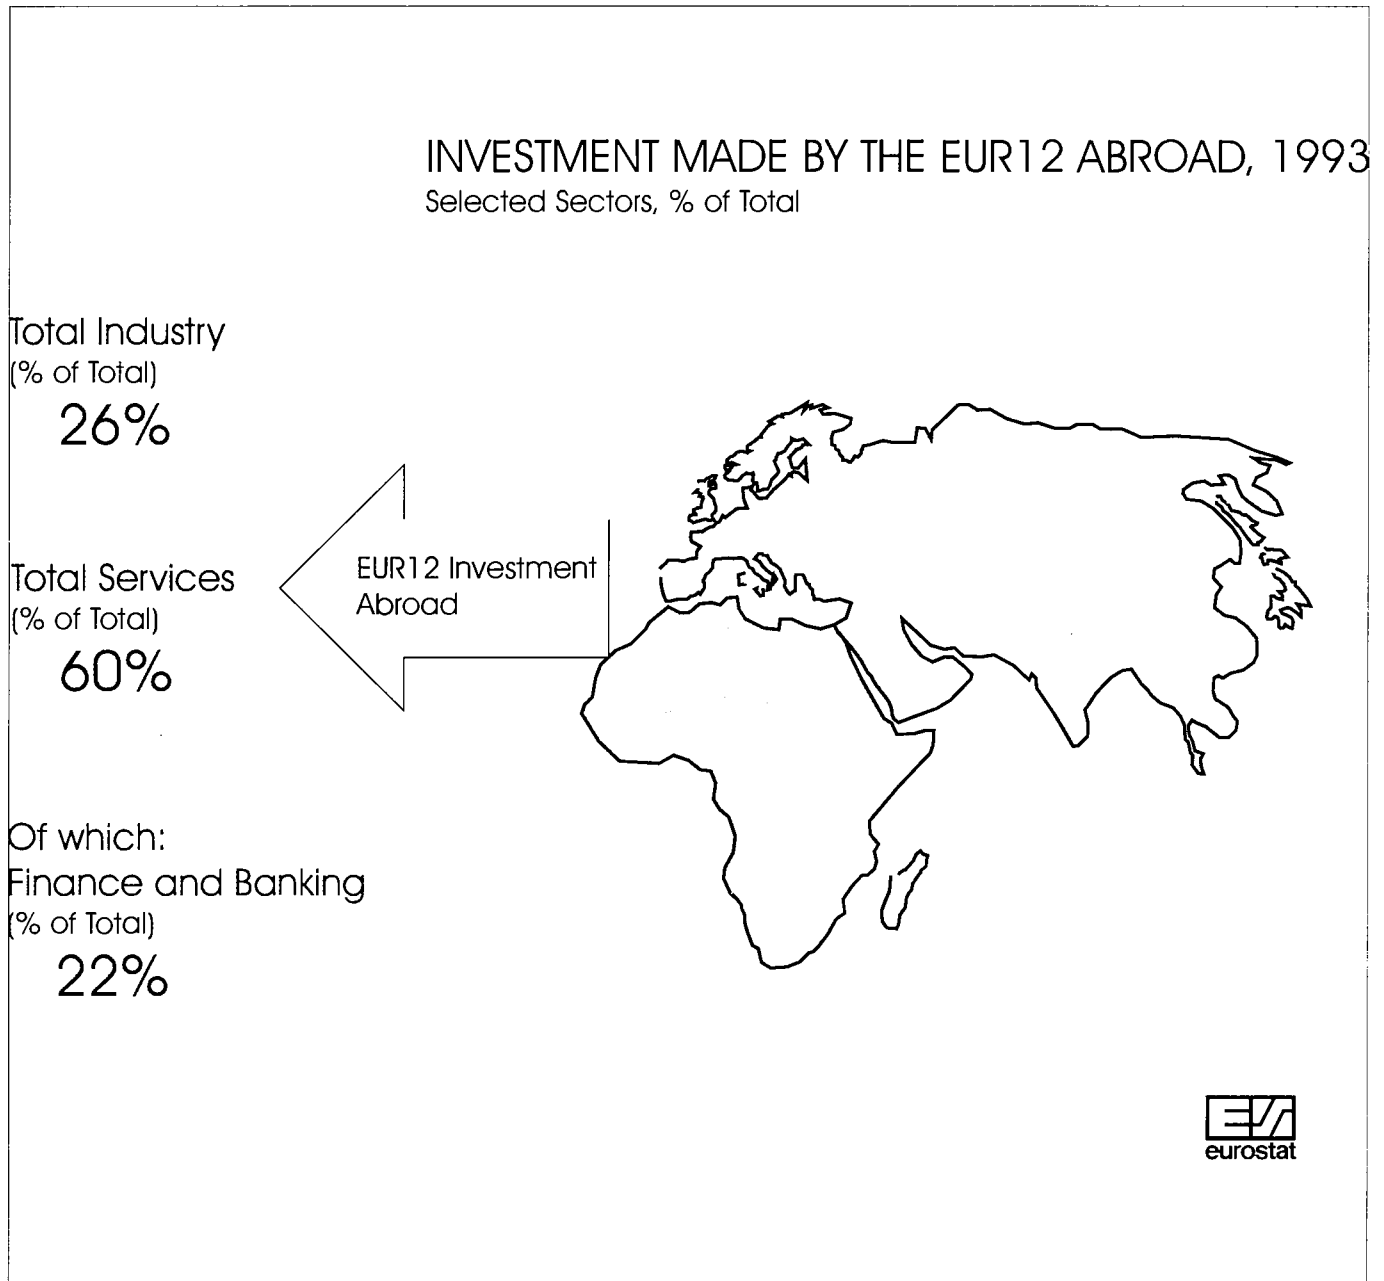

Of total investments made in the EU, 57% were hosted by the service sector. A large proportion of these flows were received by the Finance and Banking sector. The industry attracted 32% of the investment flows.

The illustration above shows the investment made in the EU (finance and banking, service and industry sector.)

For outflows, the situation is approximately the same as for inflows. Total services accounted for more than 60%

of the outflows. The foreign industry sector attracted more than 26% of the EU flows.

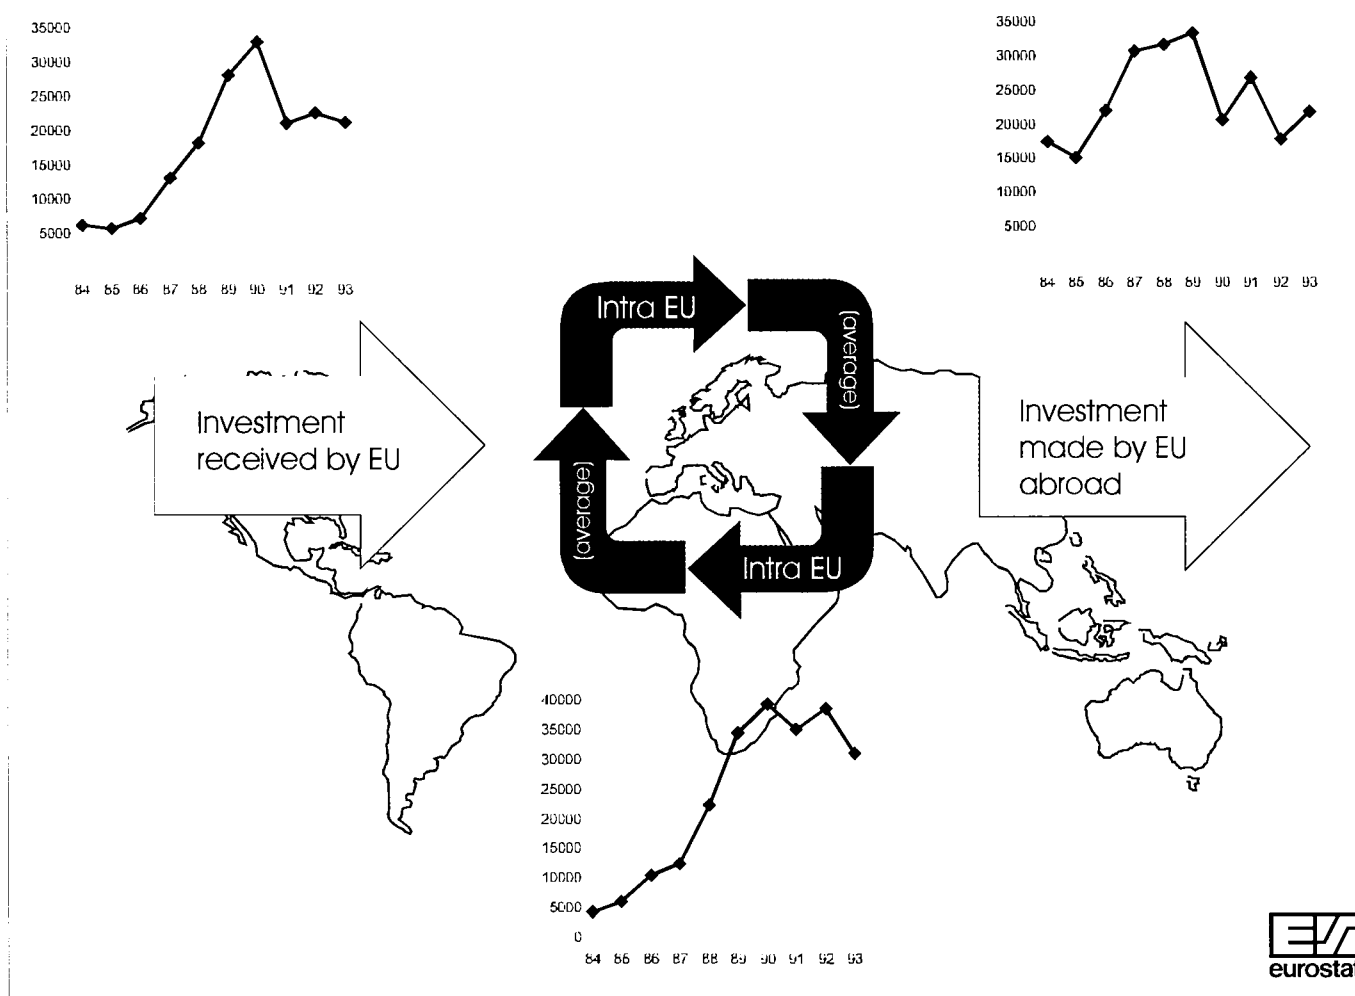

The illustration above shows EUR12 investment abroad. The most interesting sectors are exposed.

2.2. Investments and the EUR12, 1984-93

The EU market has become increasingly important as a destination for foreign direct investors, and has seen rapid growth between 1986 and 1989. The high level in 1989 and 1990, was followed by a sharp drop in investments in 1991. For 1993 only a slight decrease of 7%, compared to the previous year, can be spotted, stabilising the inflows around 21 billion (1990-1993). The EU

investments abroad have also been increasing since 1984, with a peak in 1989. Except 1990 and 1992, the EU has always been a net exporter of FDI capital and the average annual surplus of FDI exported, was estimated at around 6 billion ecus. However, this imbalance in the EU flows have continuously been dropping, substituting the large surplus until 1988 with a thereafter more balanced situation in relation to in- and outflows.

EUR12 INVESTMENT 84-93 Millions of ECU

The picture above shows the in- and outflows together with the flows within the EU.

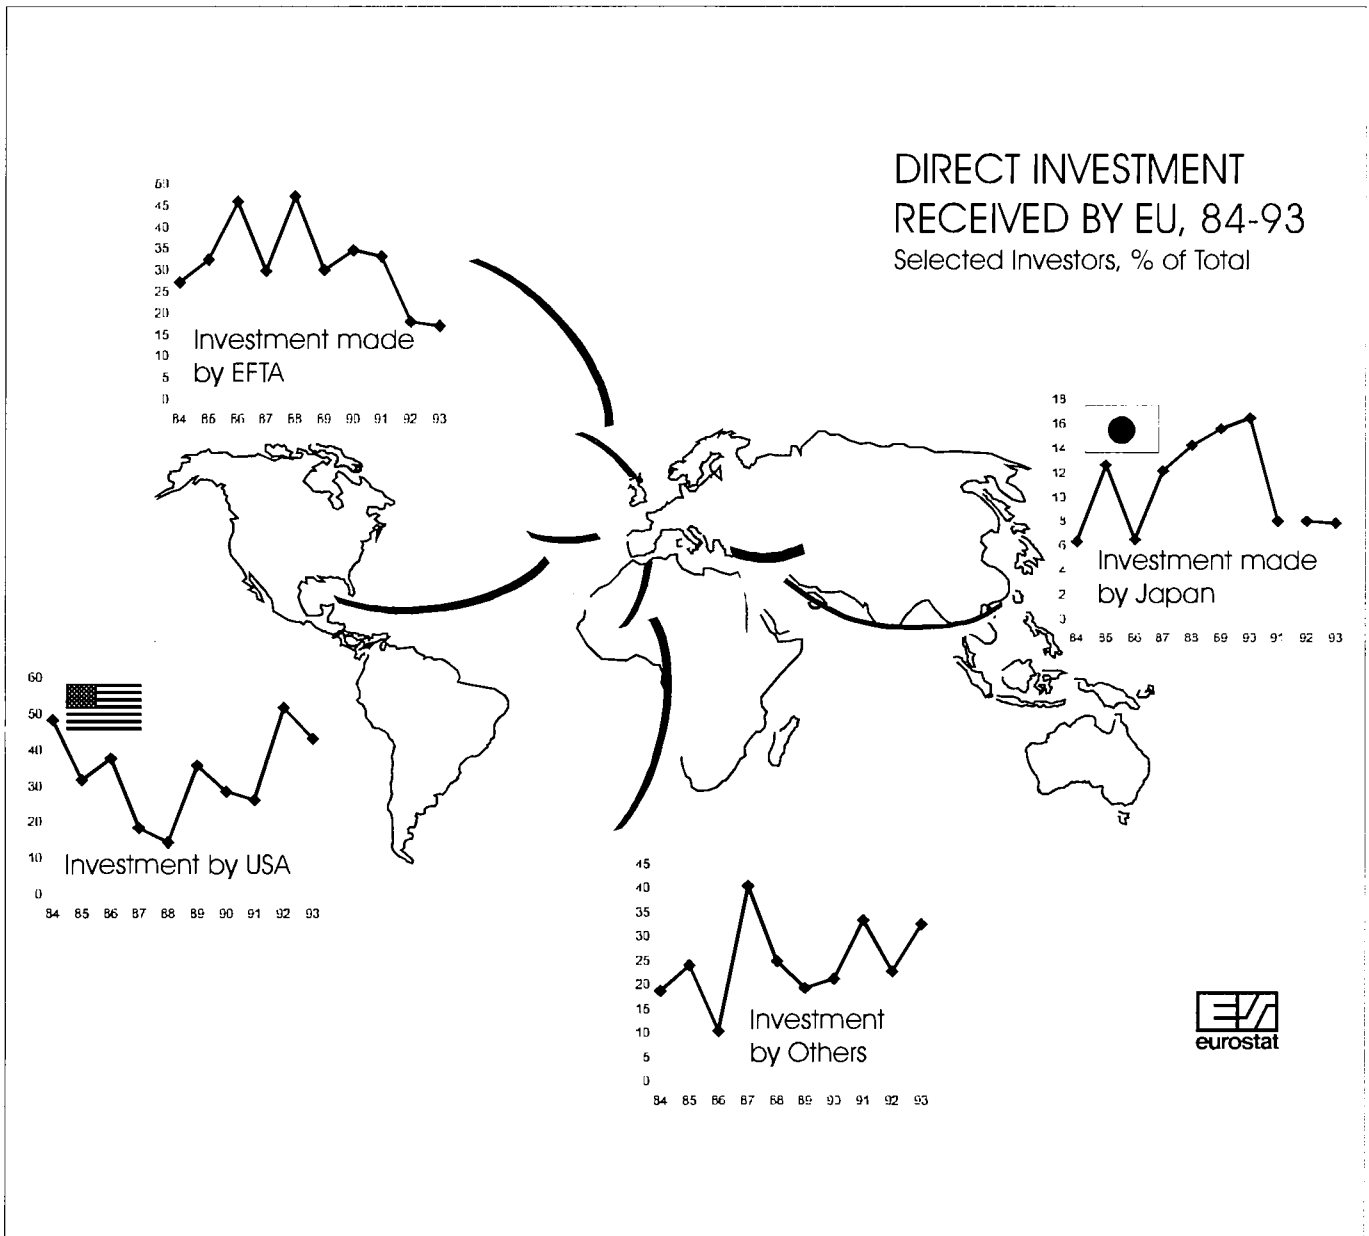

The flows within the EU have been growing rapidly in recent years and are stabilising high, at more than 30 billion in 1993. Between 1984 and 1990 the intra FDI flows have been following an average annual growth rate of 56%, and in 1990 the level of transactions was 10 times higher than the amount observed in 1984. As from

1989, the intra EUR12 flows remain bigger than the extra EUR12 flows, as the EU companies invested more in the internal market than in the rest of the world. At the same time, they received larger flows from their EU partners than from foreign enterprises.

2.2.1. Main investors in the EU, 1984-93

EFTA and US are the main investors in the European Union. While EFTA was more or less dominating from 1985 to 1991, US investors accelerated at the end and

provided 52% of the inward EU investment in 1992, and 43% in 1993. The tenfold increase of EU inward investments from 1984 to 1990 are due to a general rise in investment flows from all the players in the EU market.

	84	85	86	87	88	89	90	91	92	93
EFTA IN EU, %	27	32	46	30	47	30	34	33	18	17

Others in EU, %	19	24	10	40	25	19	21	33	23	32

The table above shows Direct Investment made in the European Union, by Japan, US, EFTA and the rest of the World.

The cumulative flows over the period 1984-1993 show that the US and EFTA countries together accounted for 64% of the total investment made by the rest of the world in the EU (see Pie chart below).

The US was the single, largest contributor with 33% of the EU inflows, just barely beating EFTA, supplying 31%. However, in recent years, the EFTA countries are losing relative importance as a supplier of capital to the EU.

The graph above shows the percentage of the cumulated EU inflows

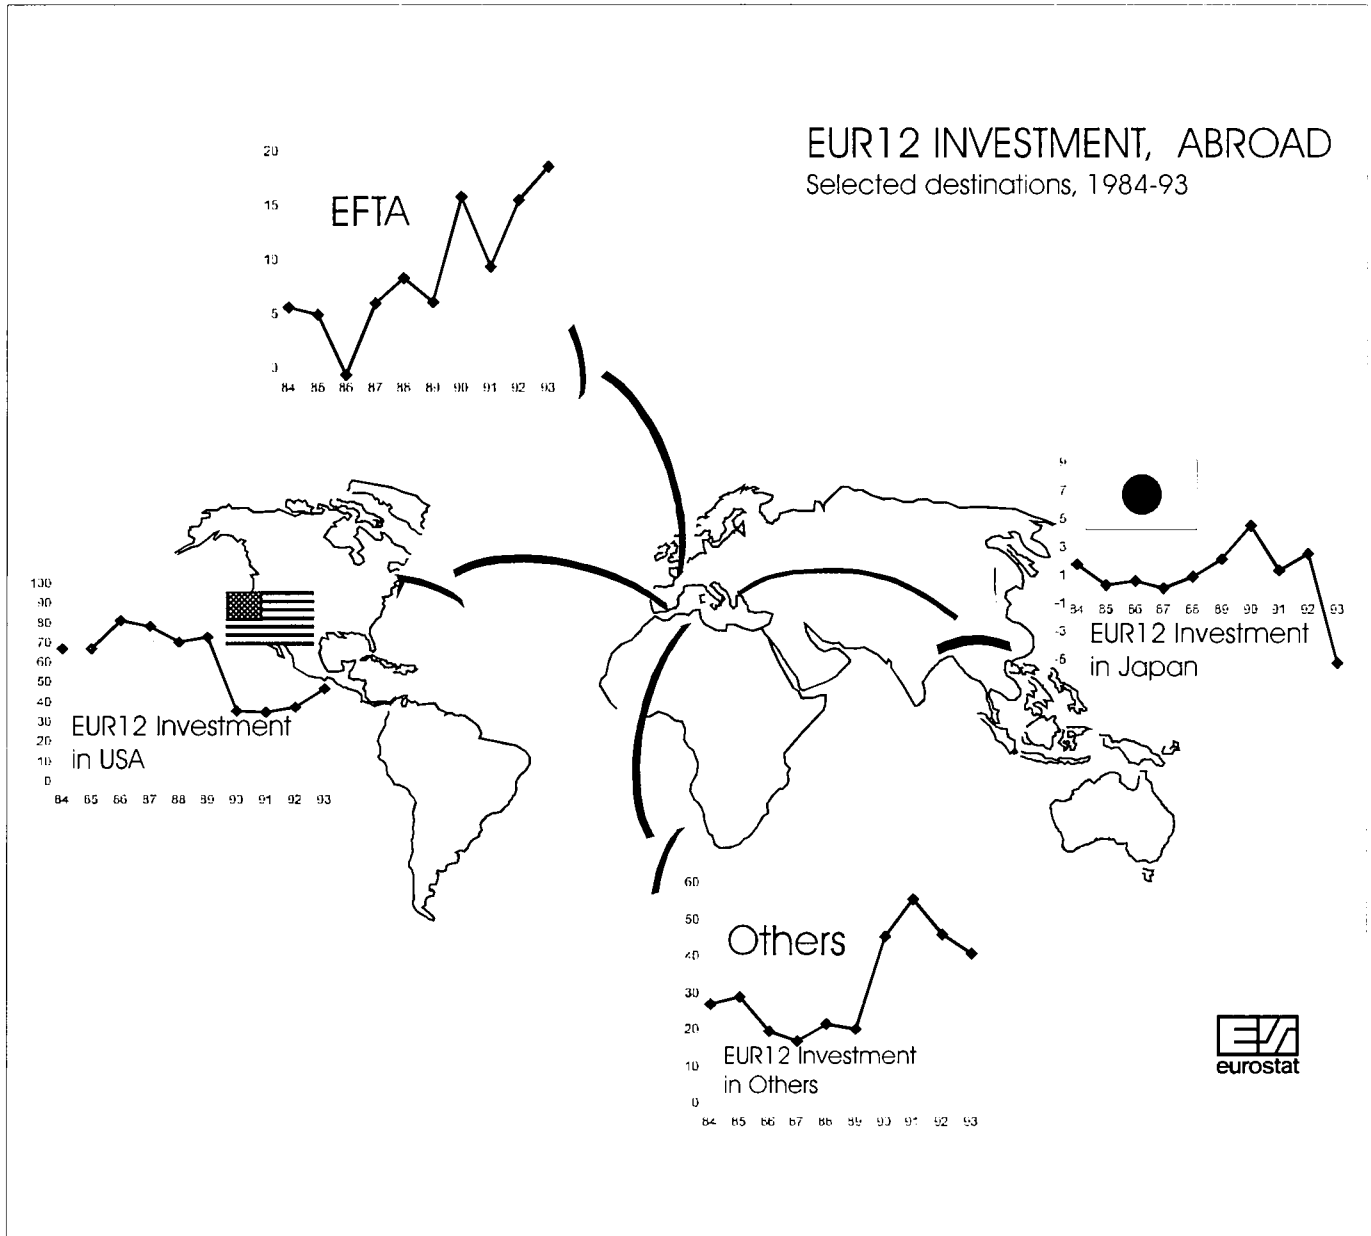

Other investors are becoming more important and reached 25% of the total cumulated inflows for 1984 to 1993. The Japanese investment represents 11% of the total cumulated flows. After participation with 15% of the EU inflows, Japanese investment fell and has during the last three years been stabilising low, at 8%. The figures from the Bank of Japan confirm that the Japanese investors are more attracted by the US market. During the past ten years, the US market hosted more than 50% of the Japanese investment abroad with one exception in 1985 when "only" 40% were hosted by the US market.

Comparing the figures from 1993 with the cumulated flows for 1984 to 1993, it is clear that Other investors (25% of the cumulated flows) and US investors (33% of the cumulated flows) are stepping up their investment links with the EU, while EFTA (31% of the cumulated flows) and Japan (11% of the cumulated flows) are reducing their share of investments in the European Union.

2.2.2. Main receivers of EU direct investment, 1984-93

Until 1989, the US was by far the biggest receiver of EU Foreign Direct Investment capital, receiving around 70% of the total EU investment abroad. Even after the sharp

drop in 1990, to 35%, the US remained the number one receiver of EU investments. Increasingly important as a host for EU investments are the EFTA countries, improving their attractiveness from almost zero in 1986 to 18% in 1993.

	84	85	86	87	88	89	90	91	92	93
EU in EFTA, %	5	5	-1	6	8	6	16	9	15	18
EU in US, %	66	67	81	78	70	72	35	35	37	47
EU in Japan, %	2	0	0	0	1	2	4	1	2	-5
EU in other, %	27	28	19	16	21	20	45	55	45	40

The table above shows Direct Investment made by the European Union abroad.

The cumulated flows for the period 1984 to 1993 show that the US and EFTA attracted almost 70% of the EU investments abroad. Almost 60% of the total cumulated flows between 1984 and 1993 were received by the US market (see pie chart below). The second largest receivers were the EFTA countries, with 9% of the flows. Japan remained a closed market and just 1% of the EU invest-

ments abroad were designated to this country. The EU continued to step up its investment links with Others, with 32% of the flows. This sharp increase goes four years back in time (1990) when EU investments with Others rose from 20% to 45%. It has thereafter (1990-1993) remained high, with an average, annual share representing 45% of the EU outflows.

The graph above shows the main receivers of EU FDI flows abroad (Cumulated flows for the period 1984 to 1993).

Comparing the figures from 1993 with the cumulated flows for 1984 to 1993, it is clear that Others (32% of the cumulated flows) and EFTA (9% of the cumulated flows) are increasing their attractiveness to EU investments,

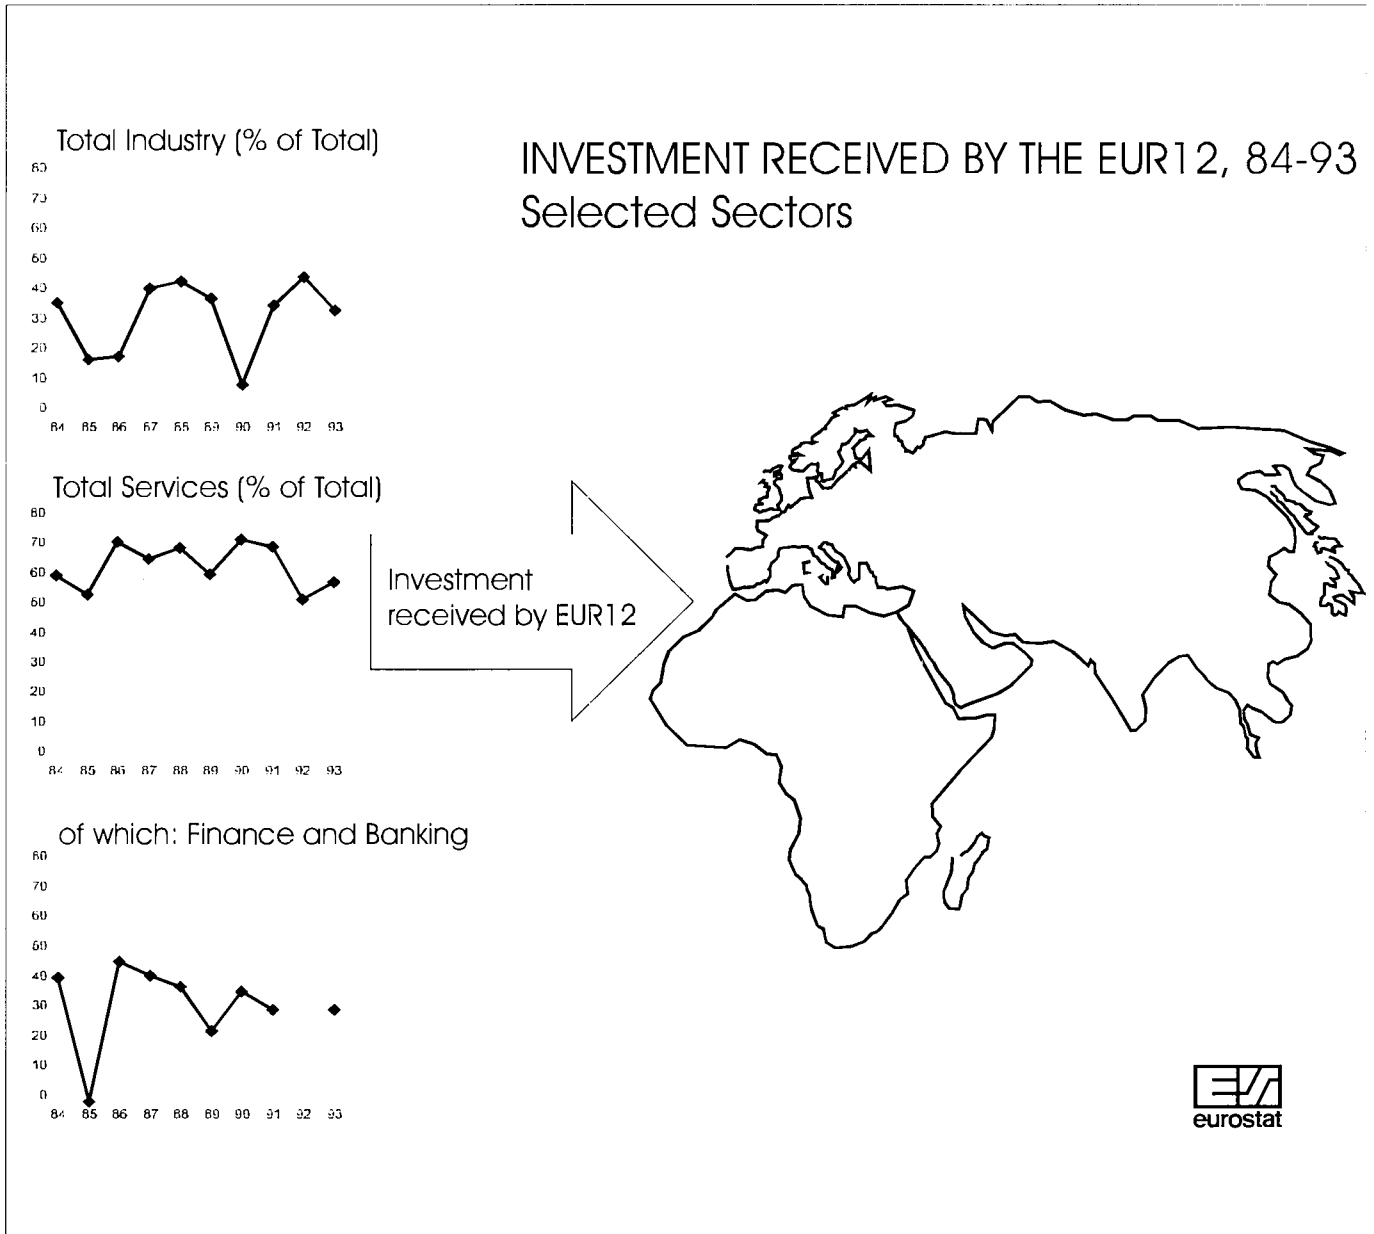

while US (58% of the cumulated flows) and Japan (1% of the cumulated flows) are reducing their share of investments made by the EU.

2.2.3. The most interesting sectors, 1984-93

Today the service sectors have become both the largest and fastest growing part of advanced economies. It is natural that international competition is developing in those sectors, and for many of them direct investment is a more effective route to foreign markets than trade. This

trend is confirmed in the table below, showing direct investment made in the European Union, by sector.

The cumulative flows over the period from 1984 to 1993, show that 63% of the flows made by foreign investors in the European Union, were hosted by the service sector, and 31% were destined to industry activities.

	84	85	86	87	88	89	90	91	92	93
Finance and Banking %	39	-2	44	40	36	21	35	28	NA	28
Total Services %	59	52	70	64	68	59	71	68	51	57
Total Industries %	35	16	17	40	42	36	7	34	43	32

The figure above shows Direct Investment in the European Union, by sector.

The investment effort is spread more widely in the opposite direction, as 40% of EU investments abroad were received by the service- and the industry sector. In fact, splitting the period in two parts highlights several trends. While more than 40% of EU investments abroad were channelled to industrial activities between 1984 and 1988, only 29% was distributed to the industry between 1989 and 1993. For the service sector the corresponding

figures were 37% for the first period and more than 60% for the second. Thus, over the past five years, approximately two-thirds of FDI transactions were related to the service sectors and, in the majority of cases, linked to financial activities. One question remains open. What is the percentage of FDI transactions made by the industry in the service sector?

	84	85	86	87	88	89	90	91	92	93
Finance and Banking %	18	20	12	6	5	8	27	30	NA	22
Total Services %	33	52	42	42	26	36	50	40	46	60
Total Industries %	16	36	47	39	57	38	48	38	51	26

The graph above shows Direct Investment made by EU abroad, presented by sector.

The service sector including finance and banking, are taking bigger and bigger shares of the total direct investment. In fact the service sector has been to direct investment growth in the 1980s what oil was in the 1970s. But whereas the oil industry was already internationally diversified and globally competitive at the beginning of the 1970s, that process is just starting for many of the service

industries. This leaves the trend of increasing direct investment in services plenty of headroom.

As mentioned before the EU used to be a net exporter of FDI capital. In particular, in the industry sector it has been a net supplier of FDI capital to the rest of the world, since 1984 (with small exceptions in 1992 and 1993).

The graph above displays the EU net investment, for the industry, service and the total sector.

From 1984 to 1988, the service sector was also contributing to the EU export of investment capital. The situation changed in 1988, and the EU was suddenly a net importer of direct investment capital, in the service sector.

The change from exporter to importer might be explained, by deregulations and privatisations taking place in the mid 1980s.

3. WHAT'S NEW

Following the growing pressure from users of FDI statistics for more detailed information a new joint Eurostat/OECD questionnaire has been adopted, the first reporting period being 1992. The main differences in comparison with the old questionnaire are a more detailed geographical and sectoral breakdown and the introduction of reinvested earnings. Eurostat has therefore been able to improve the publication in many respects with far more information available to the user. On the other hand an important work of re-allocation of data in the old framework has been performed to avoid a total break in the statistical series. The following paragraphs explain with some detail the new or revised sections introduced in this year's publication.

More information on US and Japanese flows

On the request of our users Eurostat is introducing more information on US and Japanese flows. As a result the sectoral breakdown with the US and Japan, as reporters, has been introduced for the new, detailed sectoral breakdown for 1992 and 1993. The sectoral breakdown with the US is based on the SCB (Survey of Current Business). For Japan the sectoral breakdown is entirely estimated by Eurostat.

Introduction of new members

Since Sweden and Finland joined the EU in 1995, it was natural to include FDI data for 1992 and 1993, in this publication. However, data for these newcomers are not included in the EU. That means all references to EU are referring to EUR12.

Intra EUR12 average tables

In this publication we present three tables for Intra-EUR12 FDI flows. The first two tables present flows as recorded by both investing and receiving countries.

These values do not always match and the discrepancies are what we refer to as asymmetries. The third table presents the average Intra EUR12 FDI flows (average of the two previous tables). EUROSTAT recommends that the average tables are used for studies, analysis, or practical purposes.

4. USER'S GUIDE

This chapter presents a short description of the conventions adopted and of the way in which data are organised in the statistical tables. The last paragraph represents both a warning and a solicitation to read the methodological chapters so to make an advised use of the figures.

The Sign convention

The sign convention used in this document is the same as the one used in the Balance of Payments. Capital flows are recorded:

- In the column "Abroad" with a - sign if they leave the declaring economy (investments made by resident enterprises abroad); in the column "Abroad" but with a + sign if they enter the economy (disinvestments made by resident enterprises abroad).
- In the column "In the reporting economy" with a + sign if they enter the economy (investments by foreign enterprises in the reporting economy); in the column "In the reporting economy" but with a - sign if they leave the economy (disinvestments by foreign enterprises in the reporting economy).

In addition the term NA is used to show that data, for different reasons, is not available.

The Geographical breakdown

A first set of tables presents the series from 1984 to 1993 with a limited geographical breakdown and without reinvested earnings. These series are in fact the prolongation of FDI statistics according to the old schemes and questionnaires and have been provided to avoid a break in the data series. The following classifications "other class 1", "other class 2" and "other class 3" relevant to the old geographical breakdown are no more available in the series. A second set of tables concerns only 1992 and 1993, the geographical breakdown is much more detailed, and direct investment flows have been broken down into two components: "Equity capital and other capital" and "Reinvested earnings" with "Total capital" being the sum of the two.

The Sectoral Breakdown

As for the geographical breakdown a first set of tables presents the series from 1984 to 1993 with a limited sectoral breakdown and without reinvested earnings. These series are the prolongation of FDI statistics according to the old schemes and questionnaires and have been provided to avoid a break in the data series. A second set of tables concerns only 1992 and 1993. Here,

although the sectoral breakdown is much more detailed and has been extended to the flows with the US, reinvested earnings are still not included in these series.

mismatch can be found both in the sectoral- and geographical breakdown. (When EU is mentioned it is always referring to EUR12).

Intra EU

Some tables with the EU as a declaring country and MS as partner countries are somewhat different from the others; in fact the geographical breakdown of intra-EU flows is affected by the problem of asymmetries so that both flows as declared by investing and receiving countries have been reported. The same remarks apply to the tables where MS are declaring countries and the EU the partner (For more information consult the chapter Asymmetries).

Data quality

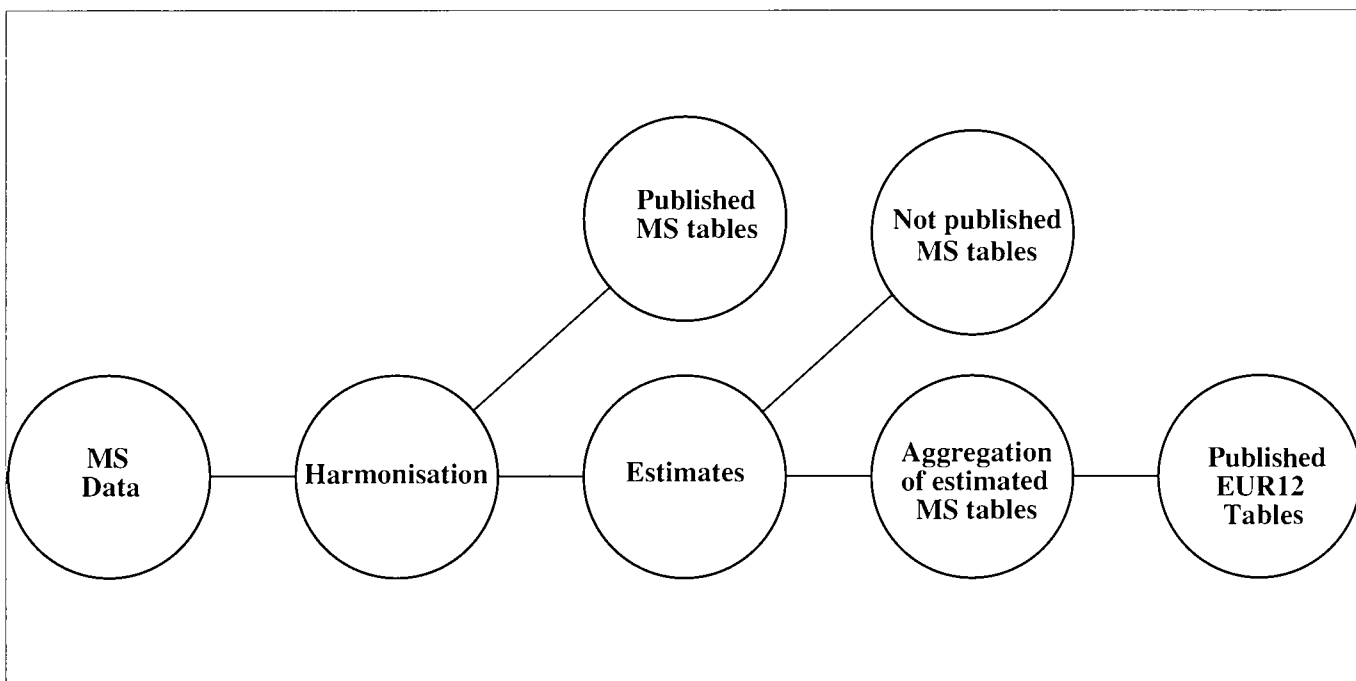

Despite all the efforts made by Eurostat some serious problems of data quality remain unsolved. The importance, both in relative and absolute terms, of the asymmetries (even excluding reinvested earnings) shows that figures should be treated with great caution. The user is therefore advised to consult the methodological chapters and to read the footnotes carefully before using the figures.

EU totals

The EU totals contain a considerable amount of estimated figures. For some countries no data is available, for others one cell can be confidential and therefore not available. This is the reason for the lack of correspondence between the MS data and the EU total, and the

The Eurostat harmonisation and estimation tasks

The illustration below shows data arriving from the MS and the following steps to produce MS and EUR12 tables.

III. METHODOLOGY

1. METHODOLOGY IN GENERAL

This chapter deals with the definitions and concepts of direct investment which have been used to compile the statistical tables of this publication.

The table below shows Foreign Direct Investment with selected Balance of Payments components, according to the IMF fifth edition.

BALANCE OF PAYMENTS	
1. Current Account	
A. Goods and services	
B. Income	
2.1 Direct investment (330)	
2.1.1 Income on equity (331)	
2.1.1.1 Dividends and distributed branch profits (332)	
2.1.1.2 Reinvested earnings and undistributed branch profits (333)	
2.1.2 Income on debt (interest, 334)	
C. Current transfers	
2. Capital and Financial Account	
A. Capital account	
B. Financial account	
1. Direct Investment (500)	
1.1 Abroad (505)	
1.1.1 Equity capital (510)	
1.1.1.1 Claims on affiliated enterprises (515)	
1.1.1.2 Liabilities to affiliated enterprises (520)	
1.1.2 Reinvested Earnings (525)	
1.1.3 Other capital (530)	
1.1.3.1 Claims on affiliated enterprises (535)	
1.1.3.2 Liabilities to affiliated enterprises (540)	
1.2 In the reporting economy (555)	
1.2.1 Equity capital (560)	
1.2.1.1 Claims on direct investors (565)	
1.2.1.2 Liabilities to direct investors (570)	
1.2.2 Reinvested Earnings (575)	
1.2.3 Other capital (580)	
1.2.3.1 Claims on direct investors (585)	
1.2.3.2 Liabilities to direct investors (590)	

1.1. Definition of Direct Investment

EUROSTAT uses as a base for its work the *OECD Benchmark Definition of Foreign Direct Investment Third Edition*, a detailed operational definition fully consistent with the IMF BPM fifth edition. The direct investment concept refers to the category of international investment

made by a resident entity (direct investor) to acquire a lasting interest in an entity operating in an economy other than that of the investor (direct investment enterprise). Direct investment involves both the initial transactions between the two entities and all subsequent capital transactions between them and among affiliated enterprises, both incorporated and unincorporated.

1.2. Foreign Direct Investor

A direct investor is an individual, an incorporated or unincorporated public or private enterprise, a government, a group of related individuals, or a group of related incorporated and/or unincorporated enterprises which have a direct investment enterprise - that is, a subsidiary, associate or branch - operating in a country other than the country or countries of residence of the direct investor or investors.

1.3. Direct Investment Enterprise

A direct investment enterprise is an incorporated or unincorporated enterprise in which a foreign investor owns 10% or more of the ordinary shares or voting power of an incorporated enterprise or the equivalent of an unincorporated enterprise or has an effective voice in the management of the enterprise. Some countries may feel it necessary to treat the 10% limit with flexibility to fit circumstances.

1.4. Subsidiaries, Associates and Branches

Direct investment abroad and in the reporting economy, are to be reported on a calendar-year basis, and should cover all directly and indirectly owned subsidiaries, associates and branches. These are defined as follows:

- Subsidiary

A subsidiary is defined as an incorporated enterprise in which the foreign investor controls directly or indirectly (through another subsidiary) more than 50% of the shareholders' voting power, or has the right to appoint or remove a majority of the members of this enterprise's administrative, management or supervisory body.

- Associate

An associate is an enterprise where the direct investor and its subsidiaries control not more than 50% of the voting shares or have an effective voice in the management of that enterprise.

- Branch

A branch is an unincorporated enterprise in the host country which can be a permanent establishment or office, a partnership or joint venture, real estate. It can also be immovable equipment and objects or mobile equipment operating within an economy for at least one year.

1.5. Direct Investment Flows

The OECD definition on Direct Investment Flows is not the same for branches as for subsidiaries and associated companies. Direct investment flows for subsidiaries and associated companies are defined as: The direct investor's share of the company's reinvested earnings, plus the direct investor's net purchases of the company's shares and loans and the net increase in trade and other short-term credits given by the direct investor to the company. Direct investment flows for branches are defined as: The increase in reinvested profits plus the net increase in funds received from the direct investor. Loans and short-term balances from fellow subsidiaries and branches to foreign direct investment enterprises, loans by subsidiaries to their direct investors, loans guaranteed by direct investors and defaulted, as well as the value of goods leased by direct investors, should be included in direct investment. However, in the case of banks, deposits, bills and short-term loans should be excluded from direct investment. The OECD benchmark definition also describes direct investment stocks and profits.

2. METHODOLOGY IN PRACTICE

To reach its final objective of compiling meaningful and reliable EUR-12 statistics and comparable MS statistics, Eurostat collects FDI data via common questionnaires from Member States. A first attempt at analysing these figures rapidly revealed a major lack of coherence in the statistics coming from national sources. These differences cannot simply be attributed to traditional problems encountered in the Balance of Payments. They stem from the fact that Member States rely on different collection methods and employ different concepts and classifications. (See also the chapter Asymmetries).

To solve these methodological drawbacks Eurostat performs two distinct corrective steps on national data.

The first step, known as "harmonisation", consists of making all necessary adjustments to improve the comparability and consistency of national data. Once national data have been harmonised they become more comparable and statistical tables for each Member State can be compiled and published within the common Eurostat classification. The most relevant sources of information used by Eurostat to harmonise data are the national Balance of Payments publications with methodological annexes and additional, punctual information provided by national compilers.

In the second step, known as "estimation", Eurostat estimates missing or unavailable data for each MS to build complete EUR-12 FDI flows. Estimates exploit secondary data sources or use knowledge-based modelling techniques. As a general rule only the estimated data for the entire European Union (EUR-12) are published.

2.1. Harmonisation of National Data

This chapter deals with the adjustments made by Eurostat on national data.

2.1.1. Harmonisation of reported data

As a first step of the harmonisation, Eurostat checks that all instructions to fill in the questionnaire have been followed by the reporting countries. When Eurostat detects relevant deviations from the recommended rules it reallocates national statistics according to the common classification.

In practice this means:

- On the geographical breakdown, to ensure that the contents of each economic or geographical zone have been filled in the same way.
- On the sectoral breakdown, to check if all the items (sub-items) have been aggregated in the same way by Member States.
- On the IMF components, to check if all the information given on the reinvested earnings (RIE) was based at least on enterprises balance sheet made at the same period. Since only three MS (France, Netherlands and UK) compile RIE following the IMF/OECD recommendations (RIE in the year of earning) Eurostat decided to allocate RIE according to the year of distribution for all MS. However, the calculation methods of RIE are not the same in each country but this aspect is not taken into account for the moment.

2.2. Methodology of the Member States and country specific adjustments

The second step of harmonisation tackles the methodological aspects peculiar to each Member State. Eurostat presents here, for each MS a short summary of the data source(s) and collection method, the main divergences from the OECD benchmark definition and finally the adjustments carried out by Eurostat on national statistics to harmonise the data.

2.2.1. BELGIUM-LUXEMBOURG

Source of data and method of collection

The National Bank of Belgium collects through the banking system (based on settlements) the statistics required to compile FDI statistics for the BLEU. The information forwarded to Eurostat is a geographical balance of the various movements.

Discrepancies regarding the OECD benchmark definition

At bank level, it is the transactor who decides whether the transaction will be recorded as a direct investment or portfolio investment. No minimum percentage of shares must be held, in an enterprise, to qualify as a direct investor. However, checks may be carried out on transactions exceeding 100 million BEF. Given the nature of the collection system, the BLEU Balance of Payments does not include profits that are not distributed and reinvested in the direct investment company. Real estate transactions are listed under a separate heading in the capital account of the BLEU Balance of Payments, but they are included in the Belgium-Luxembourg data presented in this publication. Luxembourg has a large number of holding companies whose international transactions are recorded separately in the BLEU Balance of Payments. Unfortunately the transactions related to direct investment are not distinguished from portfolio operations. In addition they are all recorded as investments or disinvestments, coming from other countries. In other words, holding companies are not considered to have subsidiaries abroad. The BLEU is for the time being, not able to identify the nature of its SPE's flows (Special Purpose Entities). Furthermore the BLEU records all the outward flows and not all the flows of resident investors, as direct investment. Capital flows between companies with direct investment links through commercial credits or leasing are not recorded as direct investment. The BLEU information system does not yet allow identification of the economic sector of the enterprise that makes or receives the direct investment.

Adjustments carried out on national statistics

From 1984 to 1993, real estate transactions have been added and flows with International Institutions have been excluded. No sectoral breakdown has been provided to EUROSTAT by the National Bank of Belgium.

2.2.2. DENMARK

Source of data and method of collection

Denmark uses bank settlements as the source of information on movements in international direct investment. The statistics are published in the annual reports of Danmarks Nationalbank and on a quarterly basis in a special direct investment report.

Discrepancies with respect to the OECD benchmark definition

In 1992 Danmarks Nationalbank made some important changes to the FDI collection system. The methodology can therefore be divided into two periods. Until 1992, Denmark was far removed from the OECD definition of direct investment flows. It did not consider any loan between associated companies as a direct investment, whether it was a long- or short-term loan, or a financial or commercial credit. Loans between associated com-

panies were recorded as "financial loans", "commercial loans", or "other movements of enterprises' capital", and therefore could not be distinguished from other loans such as bank credits. Purchases of real estate for non-commercial purposes were not classified as direct investment, as with the case of inter-company loans. As from 1992 inter-company loans and the acquisition of real estate for non-business purposes are included in the flow figures. The inter company-loans, however, are recorded on an asset/liability basis and are thus independent of the status of the resident company. Reinvested profits are estimated but still not incorporated in the FDI figures.

Adjustments carried out on national statistics

The sectoral breakdown of FDI flows is sent to Eurostat according to the resident sector, in contrast with official Danish statistics which use the sector of direct investment enterprises. From 1984 to 1991 purchases of real estate have been added to the figures initially supplied to Eurostat.

2.2.3. GERMANY

Source of data and method of collection

The National Bank of Germany, the Deutsche Bundesbank, publishes statistics on direct investment flows in its monthly reports. Resident enterprises must declare their transactions with other countries and the statistics are therefore collected by these means.

Discrepancies with respect to the OECD benchmark definition

The methodology employed by Germany still differs somewhat from that recommended by the OECD, although it is gradually being brought into line. For example, in 1990 Germany lowered the threshold for shares to be held in an enterprise in order for an investor to be considered as a direct investor, from 25 to 20%. The OECD recommends a threshold of 10%. Germany does not record the flows connected with short-term credits, commercial credits, leasing or the balances of inter-company accounts, as direct investment.

Adjustments carried out on national statistics

The Deutsche Bundesbank regularly provides Eurostat with revised figures which have been used to update the statistical tables for the year 1992.

2.2.4. Greece

Source of data and method of collection

Since 1987 the National Bank of Greece collects information on FDI flows in the reporting economy based on "authorisations". These figures are available but not

shown separately in the Balance of Payments. Direct investment can be found under various headings: Capital of enterprises according to Decree No 2687/53, Other enterprise capital, Real estate investment.

Discrepancies with respect to the OECD benchmark definition

There are many different discrepancies affecting the figures: FDI is often mixed with other categories of capital, the amount of the actual investment can vary from the "authorised" figure, investment in real estate is classified separately, loans between associated companies are not considered as direct investment unless they run for five years or more. Moreover there is no minimum threshold for a holding in the share capital of a subsidiary to determine a direct investment relationship between a resident enterprise and a non-resident enterprise.

Adjustments carried out on national statistics

Since Eurostat has not received 1993 reports from Greece, published data have been estimated. Only estimates for the Total EUR12 and World are presented in this publication. The general method used was based on the information available on the MS partner countries (plus the USA).

2.2.5. SPAIN

Source of data and method of collection

The Banco de Espana publishes statistics on direct investment flows. The main source of information is the Balance of Payments on a cash basis which allows direct investment to be broken down by country. Statistics collected by the Ministry of Economy and Trade, which receives authorisations or verifications, provide a breakdown by economic sector.

Discrepancies with respect to the OECD benchmark definition

The Spanish statistics cover virtually all the transactions of enterprises linked by direct investment. In the case of the "Balance of Payments", such a link exists as soon as the investor (a foreign investor in a Spanish enterprise or a Spanish investor in a foreign enterprise) holds at least 20% of the share capital of the direct investment enterprise. Real estate investment, which is proportionally very high in Spain, is classified separately, and the recording of direct investment flows by Spain complies with the OECD recommendations. Reinvested earnings are not recorded in the Balance of Payments.

Adjustments carried out on national statistics

Up until 1990 Eurostat has estimated the sectoral breakdown of FDI flows using information based on both Balance of Payments reports and ministry of Economy and Trade statistics. Since 1990 the sectoral breakdown has been provided directly by the Banco de Espana.

2.2.6. FRANCE

Source of data and method of collection

The French statistics on direct investment are published annually in the report "Balance of payments of France". The collection system is based on bank settlements and returns sent by enterprises to the Ministry of Finance and the Banque de France .

Discrepancies with respect to the OECD benchmark definition

Reinvested profits are not at present recorded in the French Balance of Payments. However, the Banque de France records annually reinvested profits in the International Investment Position, with a time lag of about one year and is currently examining ways of estimating figures to be included in the Balance of Payments. In principle, a direct investor must hold a minimum of 20% of the shares in a company to qualify as a direct investor. From January 1993 onwards, the minimum threshold is 10%. About the other transactions recorded under direct investment, only long-term loans of non-financial companies are presently concerned, but this will be extended to short-term loans as from 1996.

Adjustments carried out on national statistics

From 1984 to 1991 flows with International Institutions have been removed.

For 1992 and 1993, Eurostat has directly harmonised in the new framework the data sent by the Banque de France in its national nomenclature (both sectoral and geographical breakdown).

2.2.7. Ireland

Source of data and method of collection

Ireland is currently reorganising its collection system. Direct investment flows broken down geographically and by sector of activity are not available for the moment.

Adjustments carried out on national statistics (Estimates)

All the published data for Ireland has been estimated. The general method used was based on the information available on the MS partner countries (plus the USA), combined with a structure of weights based on the following three declaring countries: the United Kingdom, the Netherlands and Denmark.

2.2.8. ITALY

Source of data and method of collection

The data collection system in Italy has changed as a result of the liberalisation of foreign exchange controls. Previously, all transactions with other countries had to pass through the banking system, which then passed on information to the Italian Foreign Exchange Office (UIC). This obligation was removed in December 1990. Now all agents conducting transactions with foreign countries should complete declaration forms called C.V.S. (Comunicazione Valutaria Statistica), which are sent directly or via banks to the UIC. The fact that notifications are not mandatory undoubtedly explains the high volume of non-allocated flows found in 1991. Provisional monthly statistical data are published in the statistical bulletin of the Italian Exchange Office. The official statistics appear in the annual report of the Banca d'Italia.

Discrepancies with respect to the OECD benchmark definition

Until 1988 all holdings in the share capital of companies not quoted on the stock exchange, as well as all stock-exchange transactions for amounts exceeding Lit 30,000 million or which brought a holding to over Lit 50,000 million, were considered as a direct investment. Since then, the classification of a transaction as a direct investment depends on the transactor's replies concerning either his long-term interest and / or his active role or his holding a stake of over 20% in the share capital of the enterprise with which the transaction is being conducted. All holdings in companies that are not quoted on the stock market are always considered as direct investment. Only transactions of Lit 10 million or above (Lit 20 million from June 1990) are reported. Real estate investment is entered under another Balance of Payments heading.

Adjustments carried out on national statistics

From 1984 to 1991, Investment flows from or to International Institutions have been deducted. Investment in the real estate sector has been added.

For 1992 and 1993 the items "Electricity Gas and Water", "Extraction of Petroleum and Gas" and "Refined Petroleum and Other treatments" are included in "Mining and Quarrying". The item "Other Transport Equipment" is included in "Motor Vehicles". The item "Business Activities" is included in "Other Services".

2.2.9. NETHERLANDS

Source of data and collection method

Data collection in the Netherlands is based on a system of mandatory declaration of foreign transactions, either directly or through an approved banking establishment.

The Nederlandsche Bank publishes data in the annual report on both flows and stocks. Statistics also exist on amounts outstanding.

Direct investment flows are compiled based on information received by the Nederlandsche Bank on payments between residents and non-residents for balance of payments purposes. All residents, both banks and non-banks, are obliged to report on accounts held with non-residents. This reporting obligation has been laid down in the External Financial Relations Act (1994). Direct Investment flow figures are available on a monthly basis with a delay of 2 months. Data can be broken down by sector and by country. Data on reinvested earnings are collected using annual questionnaires on the stock of direct investment. Figures become available 12 to 16 months after the ending of a year. Figures on the stock of direct investment include reinvested earnings. Data on flows of direct investment do not include reinvested earnings.

Discrepancies with respect to the OECD benchmark definition

There is no minimum threshold for an equity holding to qualify as a direct investor in the Netherlands. Nevertheless, in practice, a 10% threshold is used as a reference for the direct investment definition. Reinvested earnings are available for statistics on investment stocks but are not included in the flow figures. Data are separately obtainable. The Nederlandsche Bank does not follow the directional principle for direct investment - as recommended by the IMF BPM fifth edition - for practical reasons. Instead direct investment is recorded according to the origin of the capital (assets/liabilities approach). Similarly loans by subsidiaries to their parent company are not recorded as recommended by the OECD. Such loans are considered as investments by subsidiaries and not as disinvestments by the parent company.

The Netherlands does not record the direct investment transactions of the Special Financial Institutions (SFIs) under direct investment. SFIs are companies based in the Netherlands which mainly specialise in group financing. Their shares are held directly or indirectly by non-residents. One SFI characteristic is that they not only take up funds abroad, but also on-lend or invest them almost entirely outside the Netherlands. Though the attending money flows are considerable, they are at the same time, from a monetary viewpoint, of negligible importance for the Dutch economy. To distinguish them from other residents they are marked as a special category of residents. Their external transactions, including direct investments, are shown net as a separate item within long-term private capital transactions.

Adjustments made to national statistics

For 1992 and 1993 no major adjustments have been made on the Dutch statistics. The 1991 and 1992 Reinvested earnings figures, as declared by The Netherlands are presented in this publication as 1992 and 1993 Reinvested earnings.

2.2.10. PORTUGAL

Source of data and method of collection

Portugal makes use of both bank settlements and "authorisation requests" to draw up its direct investment statistics. These are published annually by the National Bank of Portugal. Before 1992 reinvested earnings were recorded only if officially added to the enterprise's capital. Information on reinvested earnings, since 1992, is collected from the ICEP. The ICEP is a government institution to whom foreign investors or their representatives, in Portugal, shall declare their direct investment operations. The investors are also supposed to declare the reinvested earnings. This declaration contains information on the amount of the operation, the sectors of economic activity of the resident and non-resident, the type of operation and the country of the investor.

Discrepancies with respect to the OECD benchmark definition

The percentage of shares to be held in an enterprise in order to be recognised as a direct investor is 20%. Stock-exchange transactions, unless specifically identified, are recorded as portfolio investment and not as direct investment. Only long-term loans between associated enterprises are recorded under other direct investment flows.

Adjustments made to national statistics

Eurostat did not make any major adjustments.

2.2.11. UNITED KINGDOM

Source of data and method of collection

The Central Statistical Office (CSO) collects data on direct investment through a general enterprise survey. There is a compulsory quarterly survey of the largest companies, and a compulsory annual survey for the study of flows and income. Data from these surveys are regularly published in aggregated form in the Pink Book. Further details are given in Business Monitor MA4.

Discrepancies with respect to the OECD benchmark definition

The United Kingdom keeps fairly close to the OECD definition. However, the minimum threshold for a holding in a direct investment enterprise is 20%.

FDI flows abroad made by resident direct investment enterprises are sometimes not recorded or allocated to the country of the parent company.

Adjustments made to national statistics

For 1992 and 1993 the items "Electricity Gas and Water" and "Refined Petroleum and Other treatments" are in-

cluded in "Extraction of Petroleum and Gas". Part of the item "Real Estate and Business Activities" and the item "Trade and Repairs" are included in "Other Services". "Private purchases and sales of real estate" are included in "Hotels and Restaurants". No major adjustment has been made on the UK statistics. The 1991 and 1992 Reinvested earnings figures, as declared by the UK, are presented in this publication respectively as 1992 and 1993 Reinvested earnings.

2.2.12. UNITED STATES AND JAPAN

Eurostat has hardly any information on the methods used to compile direct investment statistics in the United States and Japan. For the United States, Eurostat used the data published in the Survey of Current Business, which are very complete and detailed, although a few figures are not given for reasons of confidentiality. The United States normally publishes series on direct investment, including reinvested earnings.

Japan has two series of data on direct investment. One comes from the Balance of Payments compiled by the Bank of Japan, but it lacks detail. The second, which gives a more detailed breakdown by country and a breakdown by sector, is produced by the Ministry of Finance, but these statistics relate to investments "notified" to the Ministry, which do not always correspond to investments actually made. In addition, the latter source uses the tax year (which begins on the 1. of April) and not the calendar year as the reference period. In general, the total given in the Balance of Payments has been subdivided in line with the breakdown given by the Ministry of Finance. In both sources reinvested earnings are not available.

3. ESTIMATION

This chapter deals with the general principles and techniques used by EUROSTAT to perform estimates followed by an overview of the main estimates relative to each Member State.

3.1. General framework for estimates and main constraints.

After the harmonisation of MS data Eurostat performs a set of operations to estimate missing information (mainly due to unavailable and/or confidential data) for each Member State. Once this process is completed MS data are aggregated to calculate the EUR-12 total; as a general rule country specific estimates are not published. Eurostat uses three basic methods for the estimations and one special method for estimation of RIE (Reinvested earnings). The methods are described below.

The partner countries declaration

A priority has been given to estimates based on information coming from partner countries' declarations.

Other sources or indicators

In some cases, the estimates of individual countries have been made using modelling techniques under constraints. Some hypotheses were made on the limits of fluctuations of some confidential data, using other indicators or information available from other sources. Some examples are the number of firms, the historical links between two countries, the "proximity phenomena" (some countries have more direct investment relationships with their neighbours) or the degree of specialisation in some specific sectors.

Cumulative flows

When the previous methods come too short, the structure of cumulative flows, based on previous series available, has been applied to allocate missing values. In most cases, the cumulated flows made in each EU partner country have not been corrected with the external exchange rate.

Method for estimation of RIE

The general method used to estimate RIE for Member States (which are not able to provide, total or partial information) can be summarised as follows:

- RIE flows involving Germany, France, the Netherlands, the United Kingdom and Portugal have been estimated using these countries' declarations.
- RIE flows between the remaining EUR12 partner countries, USA, Japan, EFTA, ACP, CIS, OPEC countries, EU and World total, have been estimated using the structure of cumulative flows available in the 1984-1993 series.
- RIE flows with the rest of extra-EUR12 economic or geographical zones have been estimated using an average structure of the EU reinvested earnings based on the addition of the five countries' declarations. For some specific zones additional available information from USA (S.C.B), Japan, and Finland has been incorporated in the estimates.

3.2. Country specific estimates 1992 and 1993

BELGIUM-LUXEMBOURG

RIE have been estimated using the general procedure. The sectoral breakdown of intra-EU flows has been estimated using the structure based on the sectoral breakdown of flows between France and Belgium (as declared by the Bank of France), between Germany and

Belgium (as declared by the Deutsche Bundesbank) and between Netherlands and Belgium (as declared by the Netherlands Central Bank).

DENMARK

RIE have been estimated using the general procedure. Very few estimates have been made on the Danish sectoral breakdown as the amount of confidential data was not high.

GERMANY

Very few estimates have been made on the German tables as the amount of confidential data was not high.

GREECE

The Bank of Greece provided Eurostat with series from 1984 to 1992, on an authorisation basis and within the old questionnaire. This information has been used to estimate the geographical breakdown of Greek flows. These estimates are presented in the Greek table just for the total EU and World. The sectoral breakdown of intra-EU Greek flows has been estimated using the structure based on:

- The sectoral breakdown of flows between France and Greece (as declared by the Bank of France)
- The sectoral breakdown of flows between Germany and Greece (as declared by the Deutsche Bundesbank).
- The sectoral breakdown of flows between Italy and Greece (as declared by the UIC).

SPAIN

RIE have been estimated using the general procedure. The structure of cumulative flows between 1990 and 1992, available within the new questionnaire, has been directly used. The sectoral breakdown with USA has been estimated using the sectoral breakdown of extra-EU Spanish flows (as declared by the Bank of Spain). For some specific cells, the information from the SCB has been used.

FRANCE

Very few estimates have been made on the French tables as the amount of confidential data was not high. 1993 RIE have been sent to Eurostat by the Bank of France in order to estimate the EU RIE, but are not presented in the French Tables.

IRELAND

All the data for Ireland had to be estimated. The general method used was based on the information available from each MS together with the USA. In addition an average EU structure of weights based on three declaring countries has been used (the United Kingdom, the Netherlands and Denmark).

ITALY

The Ufficio Italiano dei Cambi has sent estimates of the total amount of RIE abroad and in Italy. These estimates have been used in our procedures but not published. RIE have been estimated using the general procedure presented above. Left apart RIE very few estimates have been made on the Italian tables as the number of confidential data was not high.

THE NETHERLANDS

Few estimates have been made concerning the sectoral breakdown of intra-EU flows and the sectoral breakdown with the USA.

PORTUGAL

Only few estimates have been made on some specific items because the amount of confidential data was not high.

THE UNITED KINGDOM

Very few estimates have been made because the amount of confidential data was not high.

4. ASYMMETRY

In this part Eurostat would like to outline the definition of asymmetry its size and its causes, as identified in the light of harmonisation work.

Definition of asymmetry

In this publication direct investment data are presented distinguishing between "abroad" and "in the reporting economy". The separation between assets and liabilities is not made. Therefore, a transaction recorded by country A vis-à-vis country B under "direct investment abroad", has to be recorded by country B under the item "direct investment in the reporting economy", with the same value but with an opposite sign. Thus, the sum of all the transactions declared by country A in country B

and under the "abroad" item with all the transactions declared by country B under the "in the reporting economy" item should be equal to zero (and vice versa). An asymmetry is observed when this is not the case.

Because the European Union is shown as a whole declaring country, the sum of the "direct investment abroad" declared by each EU country with the rest of the European Union should be equal to the sum of the FDI flows that each EU country declared having received from the rest of the European Union. Unfortunately this is not the case and an intra-EU asymmetry is observed.

The size of asymmetry

Despite the effort made by Eurostat, the asymmetry is still important. The intra-EU discrepancy for 1993, excluding reinvested earnings, is approximately 7 billion ecus, or almost 23% of the average amount of intra-EU Direct Investment. In 1992, the intra-EU discrepancy was about 15 billion ecus, 40% of the average amount of intra-EU FDI flows.

Causes of asymmetry

The main cause of the discrepancy is the bad geographical allocation of FDI flows. Another reason is because MS use different collection systems. Some have systems based on bank settlements, others on partial inquiries using enterprise panels, or even a combination. A look at the new questionnaires revealed that no MS was capable of completing all the IMF standard components according to IMF and OECD recommendations.

4.1. Asymmetry due to different definitions of direct investors and direct investment enterprises

Depending on the country, the following transactors are or are not considered as investors or potential direct investment enterprises:

- The State

Certain countries record all or some of the transactions of their public authorities under capital movements of the official sector or similar headings. Others consider that public authorities can be involved in direct investment transactions.

- International institutions

Capital flows to and from these institutions may sometimes be recorded as direct investment. Such flows are generally State holdings in the capital of international development aid banks. One can legitimately ask whether the "long-term interest" which must form the basis of any direct investment link, is of the same type as that which connects two enterprises to each other.

- Banks

Banks' direct investment flows may be recorded with other bank flows and not with direct investment. It should be remembered that the current OECD definition recommends excluding direct investment from short-term transactions between banks and their subsidiaries.

- Households

Households may also be direct investors. The land or real estate owned by households is often recorded elsewhere or entered under a separate heading if the figures involved are very large. Whether it is property for letting or secondary residences, these assets should be considered as notional establishments of a direct investment enterprise whose activity is residential property.

- Holding companies

This term in itself already has different meanings in different countries. It can simply mean a letter box company created to exploit the tax advantages of a particular country, a company which manages the numerous subsidiaries of a large multinational, or it may mean a company created solely for the purpose of providing the parent company access to a financial market, etc. The flows of such companies are frequently recorded separately (BLEU, Netherlands), but in many cases only resident holding companies are classified separately. Including them may tend to inflate direct investment flows if, in effect, the capital simply enters and leaves. Excluding them, on the other hand, produces underestimates if the movements are in one direction only, for example if the capital entering is then redistributed to other subsidiaries in the same country.

- Special companies

Differences in the treatment of enterprises undertaking construction, installation, civil-engineering work, etc. abroad may be the cause of asymmetries between two countries.

It should be mentioned that the first four causes of asymmetry listed above have mostly disappeared in this study in the case of intra-Community comparisons, but they may continue to be valid for comparisons with non-Community countries.

4.2. Asymmetry and the link between the direct investor and the direct investment

The link between the direct investor and the direct investment enterprise is not the same, but varies to some extent, from country to country. In certain countries it is necessary to have shares in the direct investment enterprise. These countries often set a minimum threshold for

such a holding. Eurostat and OECD recommend a 10% threshold. However, in some countries no minimum holding is prescribed for a direct investment link. There may also be a minimum value for recording direct investment flows. That means any transaction below a certain value will be recorded under another heading. Quoted shares and free shares or shares acquired in return for goods or services cannot be recorded under equity holdings. They must therefore be recorded incorrectly as portfolio transactions.

The definition and inclusion of indirect links and treatment of such flows varies considerably from country to country. There are countries which do not look for indirect links at all, others that record them occasionally and some seek them out systematically. Among the latter there are many differences in the definition of an indirect link, but the asymmetries resulting from this are marginal. Most direct investment enterprises are majority-owned subsidiaries and the differences in definition mainly affect associated companies. However, the inclusion or exclusion of indirect links has an effect on:

- The treatment of reinvested earnings
- Loans between sibling companies or in other words loans between companies with the same parent company. A loan from a subsidiary in country A to a sibling company in country B can be attributed to the parent company in country C, (not in line with the OECD definition) or as originating from country A (in accordance with the OECD definition).

4.3. Asymmetry due to the different definitions of Direct Investment flows.

Depending on the country, the following do or do not form part of the direct investment flows recorded in the Balance of Payments:

Reinvested Earnings

The inclusion or exclusion of this type of flow in direct investment is mostly determined by the information collection system. It is probably one of the major causes of asymmetry. The higher and older the direct investment stock, the greater the risk of asymmetry between the statistics of one country which records reinvested profits and those of another which omits them. In other words, one can assume that countries with established direct investment traditions with enterprises that have been "physically" on the market for a very long time, reinvest because of their capacity to generate their own finance. Only five or six Community countries can at present produce statistics on reinvested earnings. The countries are Germany, France, the Netherlands, Portugal, the United Kingdom and Italy.

Long-term loans

Long-term may have different meanings in different countries. It can mean loans of over one year, loans of over five years, etc. The purpose of the loan, if it is a commercial loan, leasing etc., also can create distortions in the way flows are treated.

Short term loans

Short-term loans and inter-company account balances are not uniformly recorded as direct investment within the European Union. Certain MS consider this to be a major cause of asymmetry. The same comments as for the purpose of long-term loans apply.

Loans in the local economy

When a direct investor decides to invest in his subsidiary abroad by borrowing on the subsidiary's local market, the flow does not appear in the Balance of Payments since no border has been crossed (as in the case of reinvested profits). However, this flow will be visible if the collection system is based in part at least on a survey system. Again the differences are very much bound up with the data collection system, which may favour analysis by type of transactor or by type of transaction. A further factor responsible is the lack of a tree structure for the classification of capital accounts.

4.4. Asymmetry due to differences in recording the same flow

Even if all the points described above are apparently adhered to in the same way by two different economies, it is still not certain whether the same flow will be classified in the same way by each. This is particularly so in the case of reverse flows, i.e. when capital is supplied by a subsidiary to its parent. Another example are the so called multilateral flows, which are flows between enterprises belonging to the same group. In the case of capital supplied by a foreign subsidiary to its resident parent company, and remembering that we are dealing here with direct investment flows, is the capital a disinvestment by the parent company or an investment by the subsidiary in its parent? This problem is also at the root of numerous instances of asymmetry, since the volume of direct investment flows between the parent company and the subsidiary is extremely large. It can often be larger than acquisitions or sales of assets abroad. In the case of large multinational groups and holding companies, there is the additional question of geographical allocation of flows. If enterprise E1 located in country A establishes a subsidiary E3 in country C using funds from another of its subsidiaries E2 located in country B, the following flows will be recorded:

- Country A will record nothing at all
- Country B will record a disinvestment from A

- Country C will record an investment from B

This will result in a situation with asymmetry between A and B, and, B and C respectively. It would appear that this type of asymmetry is the cause of our largest asymmetries. The amounts of capital moved around by large multinational groups are considerable and are most likely to be incorrectly allocated because of the very complicated structures which link them.

4.5. Sundry asymmetries

In addition to the sources of asymmetries listed above, problems arise because of different ways of dealing with authorised and actual investments, exchange rates, and date of recording. These problems are also common to the rest of the Balance of Payments.

Authorised and actual investments

Certain countries only have statistics based on the administrative documents that are legally required. Some countries provide more detailed information (geographical structure of flows or breakdown by sectors) only from this source, but also have direct investment statistics from the Balance of Payments which are not consistent with the former.

Exchange rates

Certain countries convert the amount of the transaction at the rate applicable on the day of settlement, others at an average monthly rate.

Date of recording

The same transaction may be recorded on the debit side by one country at a particular date and on the credit side by a partner country at a different settlement date, which can lead to distortions if the dates are around the end of the year.

4.6. Asymmetry due to different reporting systems

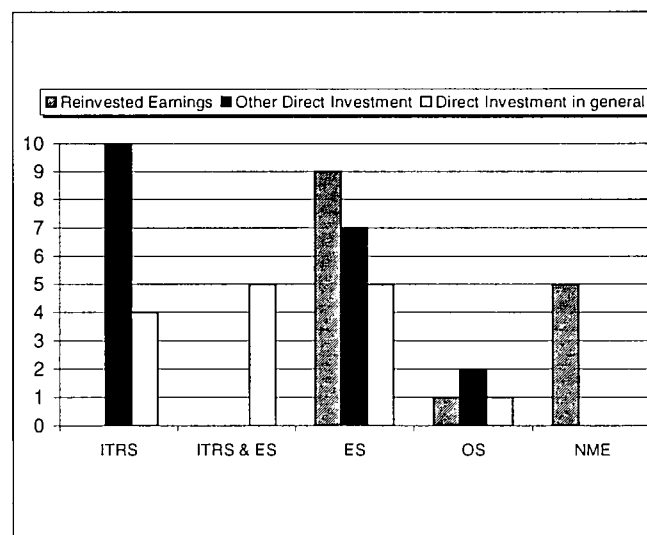

Countries have developed systems for collecting and aggregating data on international transactions that reflect their institutional structures and capabilities. Most countries use a combination of sources to compile their balance of payments statements. Even for a single component of the accounts, such as direct investment, a number of sources may be used. It is possible to focus on three features of data sources. First, data collection may be based on the reporting of individual transactions or on the aggregates. Second, data may be collected by the statistical agency from an intermediary or directly from a transactor. An intermediary can for instance be a

dealer that handles security transactions for clients. Third, data may be collected on transactions or stocks of assets and liabilities.

Principal Data sources:

- ITRS, International Transaction Reporting Systems
- Enterprise Surveys
- Official Sources
- Foreign Sources

The table below shows the principal data sources used for collecting Direct Investment data, in the industrial countries. Direct Investment is shown in general, but also as a split into Reinvested Earnings and Other Flows.

ITRS, International Transaction Reporting Systems
ITRS & ES International Transaction Reporting Systems combined with Enterprise Surveys
ES, Enterprise Surveys
OS, Official Sources
NME, Not Measured or Estimated

The most frequently used sources of direct investment data are enterprise surveys and ITRS. In the table above, 9 national compilers reported using ITRS to compile Direct Investment data, 5 reported using only enterprise surveys, and 1 reported using official sources. Of the group of nine, all the collection systems were based on compulsory reporting of individual transactions - from the banking system, directly from enterprises, or from a combination of both. The nine reporters in this category were Belgium-Luxembourg, Denmark, Finland, Germany, Italy, the Netherlands, Norway, Japan, and Sweden. Of the nine compilers, five - including Germany and the Netherlands - conducted supplementary surveys to collect additional direct investment data. Finland and Sweden have introduced surveys recently and Belgium is developing a supplementary survey. The most common source for recording Reinvested Earnings is Enterprise Surveys and nine of the 15 industrial countries were using it as a source.

European Commission

European Union direct investment — 1984-93

Luxembourg: Office for Official Publications of the European Communities

1995 — 225 pp. — 21.0 x 29.7 cm

Theme 2: Economy and finance (violet)

Series D: Studies and research

ISBN 92-827-5101-5

Price (excluding VAT) in Luxembourg: ECU 20

Are you concerned about competitiveness in the global marketplace?

This publication gives a snapshot of foreign direct investment (FDI) flows from 1984 to 1993, showing who invests where, in which sectors and at which amounts.

This publication addresses the following questions:

- Who are the main investors?
- Direct investment — who receives it?
- Which sectors are currently most attractive?
- Do European enterprises invest more amongst each other than in external markets?
- How rapidly are FDI flows increasing to and from the European Union?

FDI has proven to be an important strategic indicator and is used for high level political and corporate decisions, with the GATT negotiations serving as a recent example. With increasing globalization, national FDI figures are no longer sufficient and the need for international comparable figures, of good quality, is stronger than ever. Unfortunately today's national FDI figures differ in several ways and therefore cannot directly be compared. The reduction of national discrepancies is one major reason why Eurostat figures might deviate from those of other sources. Eurostat is, through close cooperation with Member States, able to provide internationally comparable FDI figures. This is in line with our mission to provide the European Union with a high quality statistical information service.
