Eurostat hat die Aufgabe, den Informationsbedarf der Kommission und aller am Aufbau des Binnenmarktes Beteiligten mit Hilfe des europäischen statistischen Systems zu decken.

Um der Öffentlichkeit die große Menge an verfügbaren Daten zugänglich zu machen und Benutzern die Orientierung zu erleichtern, werden zwei Arten von Publikationen angeboten: Statistische Dokumente und Veröffentlichungen.

Statistische Dokumente sind für den Fachmann konzipiert und enthalten das ausführliche Datenmaterial: Bezugsdaten, bei denen die Konzepte allgemein bekannt, standardisiert und wissenschaftlich fundiert sind. Diese Daten werden in einer sehr tiefen Gliederung dargeboten. Die Statistischen Dokumente wenden sich an Fachleute, die in der Lage sind, selbständig die benötigten Daten aus der Fülle des dargebotenen Materials auszuwählen. Diese Daten sind in gedruckter Form und/oder auf Diskette, Magnetband, CD-ROM verfügbar. Statistische Dokumente unterscheiden sich auch optisch von anderen Veröffentlichungen durch den mit einer stilisierten Graphik versehenen weißen Einband.

Veröffentlichungen wenden sich an eine ganz bestimmte Zielgruppe, wie zum Beispiel an den Bildungsbereich oder an Entscheidungsträger in Politik und Verwaltung. Sie enthalten ausgewählte und auf die Bedürfnisse einer Zielgruppe abgestellte und kommentierte Informationen. Eurostat übernimmt hier also eine Art Beraterrolle.

Für einen breiteren Benutzerkreis gibt Eurostat Jahrbücher und periodische Veröffentlichungen heraus. Diese enthalten statistische Ergebnisse für eine erste Analyse sowie Hinweise auf weiteres Datenmaterial für vertiefende Untersuchungen. Diese Veröffentlichungen werden in gedruckter Form und in Datenbanken angeboten, die in Menütechnik zugänglich sind.

Um Benutzern die Datensuche zu erleichtern, hat Eurostat Themenkreise, d. h. eine Untergliederung nach Sachgebieten, eingeführt. Daneben sind sowohl die Statistischen Dokumente als auch die Veröffentlichungen in bestimmte Reihen, wie zum Beispiel „Jahrbücher“, „Konjunktur“, „Methoden“, untergliedert, um den Zugriff auf die statistischen Informationen zu erleichtern.

Y. Franchet
Generaldirektor

It is Eurostat's responsibility to use the European statistical system to meet the requirements of the Commission and all parties involved in the development of the single market.

To ensure that the vast quantity of accessible data is made widely available, and to help each user make proper use of this information, Eurostat has set up two main categories of document: statistical documents and publications.

The statistical document is aimed at specialists and provides the most complete sets of data: reference data where the methodology is well-established, standardized, uniform and scientific. These data are presented in great detail. The statistical document is intended for experts who are capable of using their own means to seek out what they require. The information is provided on paper and/or on diskette, magnetic tape, CD-ROM. The white cover sheet bears a stylized motif which distinguishes the statistical document from other publications.

The publications proper tend to be compiled for a well-defined and targeted public, such as educational circles or political and administrative decision-makers. The information in these documents is selected, sorted and annotated to suit the target public. In this instance, therefore, Eurostat works in an advisory capacity.

Where the readership is wider and less well-defined, Eurostat provides the information required for an initial analysis, such as yearbooks and periodicals which contain data permitting more in-depth studies. These publications are available on paper or in videotext databases.

To help the user focus his research, Eurostat has created 'themes', i.e. subject classifications. The statistical documents and publications are listed by series: e.g. yearbooks, short-term trends or methodology in order to facilitate access to the statistical data.

Y. Franchet
Director-General

Pour établir, évaluer ou apprécier les différentes politiques communautaires, la Commission européenne a besoin d'informations.

Eurostat a pour mission, à travers le système statistique européen, de répondre aux besoins de la Commission et de l'ensemble des personnes impliquées dans le développement du marché unique.

Pour mettre à la disposition de tous l'importante quantité de données accessibles et faire en sorte que chacun puisse s'orienter correctement dans cet ensemble, deux grandes catégories de documents ont été créées: les documents statistiques et les publications.

Le document statistique s'adresse aux spécialistes. Il fournit les données les plus complètes: données de référence où la méthodologie est bien connue, standardisée, normalisée et scientifique. Ces données sont présentées à un niveau très détaillé. Le document statistique est destiné aux experts capables de rechercher, par leurs propres moyens, les données requises. Les informations sont alors disponibles sur papier et/ou sur disquette, bande magnétique, CD-ROM. La couverture blanche ornée d'un graphisme stylisé démarque le document statistique des autres publications.

Les publications proprement dites peuvent, elles, être réalisées pour un public bien déterminé, ciblé, par exemple l'enseignement ou les décideurs politiques ou administratifs. Des informations sélectionnées, triées et commentées en fonction de ce public lui sont apportées. Eurostat joue, dès lors, le rôle de conseiller.

Dans le cas d'un public plus large, moins défini, Eurostat procure des éléments nécessaires à une première analyse, les annuaires et les périodiques, dans lesquels figurent les renseignements adéquats pour approfondir l'étude. Ces publications sont présentées sur papier ou dans des banques de données de type vidéotex.

Pour aider l'utilisateur à s'orienter dans ses recherches, Eurostat a créé les thèmes, c'est-à-dire une classification par sujet. Les documents statistiques et les publications sont répertoriés par série — par exemple, annuaire, conjoncture, méthodologie — afin de faciliter l'accès aux informations statistiques.

Summary of main results

1. For some time now, Europe's place in the world and in particular the competitive position of the European Union have been matters of public concern (European Commission White Paper on Growth, Competitiveness, Employment - the challenges and ways forward into the 21st century). These challenges particularly concern the presence of European industry on markets with a promising future, both in geographical terms and in terms of products, since the EU's competitive position has deteriorated relative not only to the United States and Japan, but also to several newly-industrialized countries, particularly in East and South-East Asia. The Commission of the EU has particularly noted that, in the field of hightech products, the degree of specialization has been higher in the United States and Japan than in the EU, and the EU has a trade deficit on high-tech products (Commission of the EU, an industrial competitiveness policy for the European Union, Bulletin of the European Union, Supplement 3/94).

2. This study was therefore intended to provide information on the structure and development of world trade in high-tech products (HTP), with particular reference to the relative importance of HTP trade in total trade in industrial goods and trade as a whole, the changing positions of the EU and EFTA and their Member States, and the development of individual high-tech sectors. The study follows on from a previous study in 1989 and deals with world trade in HTP over the period 1989 to 1993. The study covered 110 products from ten main product groups. The selection of products was agreed on with the Statistical Office of the European Union. The regional breakdown was into four reference regions or countries, i.e. the European Union, EFTA, the USA and Japan, and their main import and export partners. Data were also collected on the individual EU and EFTA Members.

3. Such a large volume of data was used in the study (cf. table in annex) that it was possible to outline only the most important results in the text and the study had to be restricted to general issues. A more detailed analysis concentrating on selected products, selected countries or the relations between particular trade partners would enable a clearer picture to be obtained of the reasons for the various structures and developments.

4. One of the main findings was that trade in HTP accounted for an increasing proportion of trade in industrial goods and trade in goods as a whole over the reference period. Imports by the EU of HTP increased from 13.6% of total imports of industrial goods to 14.7% between 1989 and 1993. The corresponding figures for EFTA were 9.7% and 10.7%, for the United States 14.1% and 17.5% and for Japan 12.9% and 17.2%. The development on the export side was considerably weaker, with an increase from 11.4% to 11.8% for the EU and from 17.7% to 19.1% in the case of Japan. After fluctuating, the United States figure in 1993 was very high - with an increase of 29.1% over 1989, whereas the EFTA figure fell from 6.3% to 5.7%. The relatively small increase overall can be explained by the fact that the selected product groups are segments which, at least in aggregated form, have been established for many years in world trade and have already left the rapid-growth phase behind them.

5. The total HTP trade volume of the four regions/countries increased by an annual average of 5.2% to ECU 480 billion over the period 1989 to 1993, the rate of increase being 5.4% for imports and 5.0%

for exports. The sharpest increases in foreign HTP trade were in the United States and Japan, with the result that Europe's shares (EU and EFTA) fell. EU trade with non-member countries increased by an average of only 3.5% per year on the import side compared with 4.9% on the export side, nevertheless remaining below the overall growth rate for HTP trade.

6. Representing HTP trade in the form of indices clarified the trend and structure of the absolute figures. The relationship between imports and exports by a given country was represented by the trade balance (exports - imports) and the exportimport quotient (exports divided by imports). This made the EU's deficit and Japan's surplus very clear, even though there were exceptions in individual product groups or with particular trade partners. The EU was in fact in deficit only in the computer and office equipment, electronic components, consumer electronics and chemicals sectors, whereas in other product groups, such as aircraft and spacecraft, telecommunications or scientific equipment, trade was in balance or there were even surpluses. Differences also emerged in the breakdown by trade partners. In the case of trade with the United States, there was a deficit on all product groups except nuclear energy technology while with Japan there were surpluses in the aircraft and spacecraft and nuclear energy sectors. HTP trade by EFTA also showed deficits on aircraft and spacecraft and nuclear energy products in addition to the four sectors mentioned in connection with the EU.

7. The structure and development of trade in the ten product groups relative to HTP trade as a whole were strongly influenced by the predominance of the three major groups aircraft and spacecraft, computers and office equipment, and electronic components. In spite of the major differences between the product groups and hence their markets, it emerged that the proportion of the total high-tech products accounted for by these products changed very little over the reference period; there were no clear winners or losers. Among EU imports, computers and office equipment remained the most important group, with a share of 42%. Aircraft and spacecraft imports fell from 27% in 1989 to 24% in 1993, whereas imports of electronic components rose from 15% to 17%. There was also a slight increase from 4% to 5% in consumer electronics. As regards EFTA imports, the proportion accounted for by electronic components rose from 15% to 18%, whereas aircraft and spacecraft products and computers and office machinery fell from 13% to 10% and 48% to 46% respectively. On the exports side, EU exports of electronic components rose from 13% to 16%, consumer electronics from 3% to 5%, scientific instruments from 4% to 5% and machinery from 3% to 4%. Exports in the aircraft sector fell from 35% to 30%. EFTA exports of electronic components rose from 16% to 19%, consumer electronics from 3% to 7% and scientific equipment from 10% to 13%, while the proportion of telecommunications equipment fell sharply from 12% to 5% and that of weapons from 9% to 3%.

8. The specialization index (RCA index) shows the extent to which a given country specializes in the export (or import) of a given product. A rule of thumb is that above-average specialization on imports of one product is accompanied by a corresponding dependency on supplies of this product, whereas similar specialization in exports means a good competitive position for this product on the world market. The EU's HTP trade showed below-average specialization, as mentioned previously, but with widely varying situations in the individual product groups. In most of the groups specialization was below average in the case of EU imports. Exceptions to this were computers and office equipment (average, with slight upward tendency), nuclear energy technologies (above-average in 1993 after an increase) and chemical products (slightly above-average, fluctuating). On the export side, the EU's degree of specialization dropped overall. Specialization in aircraft and spacecraft, telecommunications, scientific equipment and machinery was above average and in some cases exhibited a further upward tendency, while specialization in nuclear energy technology and weapons was decreasing. EFTA imports showed an above-average degree of specialization in nuclear energy technology, chemical products, weapons and, since 1992, consumer electronics. In all other product

groups, however, and in HTP overall the degree of specialization was above average. The degree of specialization in EFTA HTP exports was well below average, but there were a number of notable exceptions where the degree of specialization was in some cases extremely high. These included, weapons, machinery, scientific equipment and telecommunications (steep downward trend). Specialization by the United States and Japan was very much above average in the case of exports, whereas specialization in Japan was below average in the case of imports, but the indices showed an upward development. In the case of the United States, this increase led to an above-average degree of specialization on the import side too since 1991.

9. The level of intra-industrial trade was shown by means of a special index measuring the extent to which trade between two partners in a given product area was in balance. A high degree of balance (index value: 0) shows that both the production of partners in a given product area and their openness to free trade are high. The results for the EU in this respect were very good, while those for the United States and EFTA were also satisfactory. It should be pointed out, however, that good or satisfactory overall results may conceal balancing effects resulting from very wide variations in the trade relations between various partners or different trade levels in different product groups (positive or negative differences in levels of trade). For example, the index value of less than 0.1 (the scale ranges from -1.0 to +1.0) for EU trade in high-tech products overall and with all trade partners resulted from the fact that sectors with export surpluses (e.g. aircraft and spacecraft, telecommunications and scientific equipment) were offset by those with import surpluses (computers, electronics). The same phenomenon was observed in the regional distribution: export surpluses with EFTA and certain newly-industrialized countries were offset by import surpluses with the USA, Japan and other newly-industrialized countries. In the case of Japan, intra-industrial trade accounted for a very small proportion of its total HTP trade with all partners. There was therefore no balancing effect.

10. Within Europe, there were clear differences between the various Member States. In the European Union, France, Germany and the United Kingdom were the three leaders in terms of trade volume. Throughout the reference period, France's HTP exports were clearly in excess of those of Germany and the United Kingdom, and France was therefore able to achieve increasing export surpluses throughout the reference period, with the exception of 1990. The main high-tech products imported and exported by France were in the aircraft and spacecraft sector and computers and office equipment. Other product groups accounted for no more than one tenth of the total trade. The computer sector predominated in German HTP imports, followed by aircraft and electronic components, while these three sectors were of about equal importance on the export side. Germany's foreign trade in high-tech products overall was marked by major import surpluses. The ranking in British imports was similar to the situation in Germany, whereas computers, aircraft and spacecraft and, increasingly in recent years, electronic components were the main export sectors. The United Kingdom also had import surpluses, which were in fact on the increase. Within EFTA, Switzerland was the leader, followed by Sweden and Austria, in terms of volume of trade. In addition to the product groups mentioned above, scientific equipment and machinery were important export products in the EFTA countries.

11. An examination of external trade in high-tech products from the point of view of the individual EU and EFTA countries showed that the geographical situation influenced trade in addition to the different developmental and industrialization situations. For example, Denmark's imports from EFTA countries were the highest of all the EU Member States - probably because of its Scandinavian neighbours. Imports from overseas (United States, Japan, newly-industrialized countries) were well over the EU average in the case of Ireland and the United Kingdom. However, on the export side, Ireland was very much geared to the EU (further processing of imports from overseas for the EU market). A

relatively large proportion of Spain's exports went overseas. Imports of HTP from overseas accounted for a larger proportion in the EFTA countries than in the EU, except in the case of Switzerland. The EU was the main market for exports in most cases.

12.It can basically be assumed that trends in HTP trade can reflect the level of economic development and technological progress in the individual countries covered. However, these trends must be supplemented by other indicators in order to obtain a complete picture. These other indicators include expenditure on R&D in the individual countries, innovation, licensing transactions and the establishment and operation of joint ventures. The influence which political decisions may have on the development of foreign trade in sensitive products such as weapons and nuclear-energy technology should also be taken into account.

13.For the reasons mentioned, it was possible only in exceptional cases to make pronouncements on the detailed reasons for trade developments. Short-term economic influences undoubtedly had a considerable part to play - for example, the exceptional situation of Germany following the unification at a time when other countries were already undergoing recession. Individual contracts in the aircraft and spacecraft sector are also probably reflected in the development of trade between two partners, as are political decisions.

14.The study outlines the state and development of world trade in high-tech products on the basis of a large volume of data. The results presented, together with the tables in annex, could provide a basis for further, more detailed analyses.

One important finding was that the European Union, in spite of being a very important partner in world trade in HTP, was relatively lacking in dynamism. In the assessment of EU trade, also taking into account the recent enlargement to fifteen Member States, a distinction must be made between trade relations within the Union and relations with non-member countries. Regarding EU external trade as consisting exclusively of extra-EU trade, along the lines of the foreign trade of the United States, would give an incomplete picture. The intensification of intra-EU trade continues to be an essential condition for healthy economic development within the Union, even if intra-Union trade at least sometimes takes priority over extra-Union trade. Only if both types of trade are taken into account can a picture be obtained of the economic capacity and competitive position of the individual Member States and hence of the European Union as a whole.

The statistical annex was compiled by Inge Kunz on the basis of data provided by Eurostat. The text section was formatted by Katharina Hage-Maier and Anni Heidler.

Introduction

It has often been maintained in recent years that the EU was losing ground in world competition - particularly relative to the United States and Japan, which were overtaking Europe in leading-edge research and development¹. However, Europe was also thought to be lagging relative to a number of newly industrialized countries, which were making up their backlog in the production of technically ambitious industrial goods. A distinction must be made, however, between comparisons at a given point in time and comparisons of developments over given periods. There are, for example, high-tech branches in which the Members of the European Union still occupy second place behind the United States and before Japan, even if the United States' lead over Europe has become greater and Europe's lead over Japan smaller in recent years.

The resultant challenge particularly involves the presence of European industry on regional and product markets with a promising future.

In a report on industrial competitiveness, the Commission of the European Union states¹ that "the Union is still less specialized in high-technology products than either of its two leading rivals" and that "since 1986 the Union has had a trade deficit in high-technology products". These statements are illustrated by OECD export structure figures, according to which in 1990 the European Union accounted for 36% of exports of high-technology products (United States 24%), 44% of exports of medium-technology products (United States 13%) and 41% of low-technology products (United States 11%). Observations to the effect that the United States' export quotients on high-tech products is much higher than those of Japan or even Germany are in line with this. However, such observations must be put into perspective. Unlike Japan or Germany, United States exports are below average relative to total production, which means that production sectors in which there are only a few competitors and customers in the world - i.e. high-tech products - enjoy above-average demand from abroad and therefore become important components in external trade.

This example shows that a country or economic region's place in world-wide competition requires serious study if a sound assessment of the relative competitive positions is to be made.

1. Commission of the European Union, *White Paper on Growth, Competitiveness, Employment - the challenges and ways forward into the 21st century*, Brussels-Luxembourg 1994.

2. European Commission, *An Industrial competitiveness policy for the European Union*, Bulletin of the European Union, Supplement 3/94; pp19 and 60.

1. Aims and methodology

1.1 Aims

The aim of this study is to provide information on the direction, scale and development of international trade in high-tech products. It thus follows on from a previous study¹ with the same aim. Specifically, the study aimed to ascertain whether:

- trade in high-tech products had a more rapid growth rate than trade in industrial goods or total trade;
- the European Union, EFTA or their Member States had become stronger or weaker;
- developments in the individual high tech fields varied widely.

The **reference period** on this occasion was the years 1989 to 1993. The main **regional** subdivisions (and reference/reporting countries/regions) were the European Union (EU), the European Free Trade Association (EFTA), the United States and Japan. Their external trade in high-tech products was analyzed by product groups, individual products, branch and technological level (Part 2). The HTP foreign trade of the individual EU and EFTA countries was also examined (Part 3).

The data were supplied by Eurostat. Some data were delayed as a result of the introduction of a new system for collecting data on intra-Community trade. This also meant that the study was completed behind schedule.

Part 1 begins with a description of the methodology, which resulted from theoretical considerations, the development of instruments for assessing the relative position in international competition and definition problems regarding the choice of products, branches and regional aggregates.

1.2 Theoretical considerations

The chances of maintaining or improving the competitive position on the international market are assessed on the basis of the previous position of a country or group of countries in the field of high-technology and of whether the country or group has been able to keep up with technical progress at world level.

Several instruments can be used for an assessment of this kind. The measurement of research input (human and financial resources) starts at a very early point in the research/research result/application development/product development/marketing chain and generally speaking does not permit a detailed analysis. By using patent statistics (applications, grants) or bibliometric analyses, research output can be measured in such a way as to obtain very detailed results. This process begins at the researchresult and applicationdevelopment stage.

At an even later stage - marketing - externaltrade analysis, possible supplemented by production analysis, can be applied. However, this entails the problem that the possibilities for breaking down external trade or production do not adequately match actual progress in the real world, since high-tech products are often just components in products which have to be classified at a lower technological level. Only products (groups, branches) which are classified as high-tech over a period of several years stand a chance of showing up separately in the statistics.

1. EUROSTAT, *Statistical analysis of extra-EUR12 trade in HI-tech products*; Bruxelles-Luxembourg, 1989.

It should also be pointed out that the use of human or financial resources, patent statistics or bibliometric analyses also point to the future, in that today's research efforts and successes are tomorrow's commercial successes. An analysis of external trade or production, on the other hand, can only shed light on the past or, at best, enable a trend to be identified.

All the above-mentioned methods of assessment are limited in their applicability and significance, which means that it would often be useful for the purposes of a study of competitive positions and developments to use a variety of approaches - for example, studying the number of inventions for which a patent has been applied for and the balance of licence fees.

The aim of this study has been defined as the determination of the competitive position of individual countries and groups of countries in external trade in high-tech products.

Inter-industrial trade no longer plays such an important role in the national economy. Prices or comparative cost advantages are no longer the only driving forces behind external trade: different levels of availability of technology and a high level of specialization are also important nowadays. This gives rise to intra-industrial trade, i.e. trade in similar products which can act as substitutes for each other. If availability of technology is generally speaking a determining factor in intra-industrial trade, it can be assumed that intra-industrial trade will play a particularly important role in the case of high-tech products, with the result that price ceases to be the central deciding factor.

It follows, therefore, that deterioration of a country's position in international trade should not be countered by means of protectionist measures, but rather by promoting technological progress.

1.3 Definitions

The research effort involved is undoubtedly a relevant factor for qualifying a process or product group as high-tech. For many years therefore, branches of industry have been subdivided into high-tech and other branches on the basis of the proportion of their turnover spent on R&D. However, since in most branches it was not possible to further subdivide the amounts spent on research, **all** products of a given branch were automatically classified as high-tech products, if the branch as a whole met the criteria.

Obviously, an attempt had to be made to arrive at a more precise distinction by means of a product-related selection process. The Statistical Office of the European Communities had a product list, in turn based on an older OECD list, which was used for the previous study. There was also a list produced by the Fraunhoferinstitut für Systemtechnik und Innovationsforschung, a "Statistical Canada" compilation, which is also used by the US Department of Commerce, an IFO Institut list, a DG XIII list (including only office equipment, computers and electronics) and the "Lambertz-Liste" produced by Eurostat.

The original list used by the IFO Institut, which was relatively restricted, was based on studies in which various fields of high-tech research were analyzed in terms of patent statistics, and on the knowledge of the persons responsible for the branch in question at the IFO and their contacts with experts in research and industry.

This meant that the classification of certain products as high-tech products depended to a great extent on subjective assessments, which reflected considerations or interests in the field of industrial, trade or research policy and findings of other studies of the hightech market.

The product groups selected for this study are therefore the result of a lengthy process of discussion and coordination between Eurostat and various of the above-mentioned institutions. The concept of

a high-technology product is based on the underlying innovation and/or (new) application. Innovations in processes are left out of account, even though the manufacturing process can determine whether or not a product can be described as high-tech. For example, insulin obtained from the pancreas of cows or pigs is not a high-tech product, whereas insulin produced by genetic engineering is very much high-tech. However, neither external trade statistics or production statistics permit a distinction of this kind to be made but, apart from problems of this kind, it would in principle be useful to take account of the manufacturing process used when defining a high-tech product, if leading-edge technologies are involved.

The list used for this study comprised 110 products, from 10 product areas:

- aircraft and spacecraft;
- telecommunications;
- office equipment and computers;
- electronics (electronic components);
- consumer electronics;
- scientific instruments;
- mechanical engineering;
- nuclear energy;
- chemical products;
- weapons.

Without going into possible criticisms of individual items in the list, it should be pointed out that the significance of certain product areas, such as chemical products and telecommunications, is not adequately represented by the import or export values of the selected products.

The sub-division into top, medium and low high-technology represents an attempt to go into further detail in the product-based selection. Differences in the lists used and differences of opinion as to what constitutes a high-tech product are also reflected in the actual classification of the individual items in one of the three categories.

The general problem of how to classify low-tech products which include high-tech components is not solved by these attempts at further differentiation either. The possible breakdown of the total production value into high-tech and low-tech components is usually known only to the manufacturer.

1.4 Coverage of trade developments and regional delimitation

External trade data are analysed from various angles. First of all the structure and development of trade are studied for high-tech products as a whole and for the ten product groups under consideration, a distinction always being made between the reference countries and regions (EU, EFTA, United States, Japan) and the partner countries and regions (including, in addition to the countries and regions already mentioned, the six or nine most important newly-industrialized countries, the world as a whole and, in some cases, other regions).

The product groups are examined for individual important products, and classification into top, medium and low high-tech is carried out within the product groups. An attempt is also made to subdivide the groups by branch.

The comments on and presentation of absolute figures and proportions is supplemented by data on the trade balance, the export-import quotient, the specialization index (which shows the extent to which a reference country with a given partner country specializes on a given product sector) and intra-industrial trade (which shows the level of imports and exports in a given product area). This analysis is carried out at both the highly aggregated regional level of the for reference countries and regions, and at the level of the individual EU and EFTA Member States as reference countries.

Commenting on large volumes of data presents problems, as the comments should not simply consist of references to the contents of tables. It was therefore attempted, in a number of cases, to explain the reasons for certain structures or developments which had come to light, but this was not done in any systematic manner, since it was not possible in view of the range covered by the data and the very widely-varying situations, depending on the product, partner countries and year concerned, to research the reasons in any degree of detail. Instead, it was decided to draw attention in the text to peculiarities in the figures (structures and developments which departed from the average), in order to incite the reader to study the tables in detail.

There is no point in comparing this study with the previous study in 1989 with a view to updating the structures and developments identified on that occasion, since the choice of products and their classification according to product groups is totally different. In the previous study, mechanical engineering products were divided into the sub-categories "electrical" and "non-electrical", but telecommunications equipment and consumer electronics were lumped together. Pharmaceutical products were not included in the present study, whereas nuclear energy technology and weapons were covered for the first time.

1.5 Summary

The aim of the study is to examine world trends in trade in high-tech products on the basis of current economic and external-trade theory and using traditional statistical methods. This trade is an important indicator of the economic development and technological level of the regions and countries under consideration, but not the only one. Investment abroad on research and production, the establishment of joint ventures, invention or the granting of licences instead of supplying goods are entrepreneurial activities which are also important indicators, but do not show up in external trade.

It should also be borne in mind that, in sensitive product areas such as weapons systems, nuclear energy or air and space travel, political decisions rather than technological advances not infrequently determine the direction and development of trade. In such cases, an increase in the share of the market does not automatically mean higher competitiveness. Furthermore, the high-tech content varies widely from product to product and from country to country and these variations are not reflected in the external trade statistics. Notwithstanding these limitations, the study provides important information on the distribution of technical progress in the world by revealing the most recent trends in world trade in high-tech products.

2. Analysis of trade by product

2.1. Introduction

This part of the study examines external trade in high-tech products, broken down into ten groups, from the point of view of the reference regions EU and EFTA and the reference countries United States and Japan. For the purposes of an initial overview a large number of other countries and country groups were also taken into account as trade partners (as opposed to reference countries) in addition to the regions and countries mentioned.

Subsequently, the study is restricted to the EU, EFTA, United States and Japan and two groups of newly industrialized countries (NICs), referred to as NICs6 and NICs9 (or grouped together as NICs15¹) in the tables. NICs6 comprises Malaysia, Thailand, Singapore, Hongkong, Taiwan and South Korea. NICs9 comprises the Philippines, Indonesia, China, India, Israel, Turkey, Argentina, Brazil and Mexico.

The main distinction between the two groups of countries is regional - i.e., South-East Asia and "other" (with the exception of the Philippines and Indonesia) - but the figures would also suggest a different economic and technological level, at least as regards the average for the group, since it cannot be assumed that, for example, the economic and technological level of Israel and India is lower than that of Malaysia and Thailand. It is a statistical fact, however, that NICs6 are important trade partners for the major reference regions and the countries, whereas NICs9 trade with them only in exceptional cases.

2.2 World trade in high-tech products²

EU imports and exports very much predominate in the structure of external trade, if intra-EU and extra-EU trade are both taken into account. If only extra-EU trade is considered, the leader is the United States, followed by Japan on the export side.

Of total imports by the four reference regions or countries, the EU accounted for almost 54% and the United States 32% in 1993. Imports by EFTA and Japan were on a smaller scale. The situation on the export side is more balanced (Table 1).

Table 1:

Main trade flows in high-tech products

Reference Region/Country		Imports/Exports (ECU million)		Partner's share in 1993 (%)					
		1989	1993	EU	EFTA	USA	Japan	NICs6	Other

	Export	42 985	57 025	20.9	1.1	40.4	-	27.2	10.4

a) Partner's shares refer to extra-EU or extra-EFTA trade

1. The countries constituting the NICs6 and NICs9 groups were specified by Eurostat.

2. The Data commented on this section can be found in Tables 1.1 to 1.6 in the Annex (A 1.1 to 1.6, import M, export X), if no reference is made to in tables in the text (excluding A).

Extra-EU and extra-EFTA trade is shown separately in order to illustrate the position of the two free-trade areas vis-à-vis the outside world. Intra-trade is of major importance only in the case of the EU.

A comparison of absolute import and export figures in Table 1 very clearly identifies the reference countries and regions as net importers or exporters of HTP. If exports are compared with imports in order to get an idea of the extent to which imports were covered by exports, the following quotients are found for 1989 and 1993:

	Japan	USA	EU	EFTA
1989	3.7	1.3	0.9	0.6
1993	3.3	1.2	0.9	0.6

A comparison of imports and exports¹ of high-tech-products, industrial goods² and total trade reveals different shares, which means that HTP imports have increased more rapidly than imports of industrial goods or total imports, and that this increase was much greater in the United States and Japan than in the EU or EFTA. On the export side the proportion of HTP increased only slightly in the case of the EU and even fell in the case of EFTA, and fluctuated from year to year in the case of the United States. Only in Japan did the proportion of HTP increase relative to its exports of industrial goods and total exports. However, this increase was less than on the import side (Figs 1 and 2). Measured in these terms, Europe is lagging behind the United States and Japan in external trade on high-tech products.

The data also give an insight into the relationship between industrial goods and goods as a whole in external trade, which permits certain conclusions to be drawn regarding the supply and demand structure. Japan occupies an extreme position in this respect, since less than half of its total imports were industrial goods, whereas in the case of exports industrial goods accounted for almost 97% of the total. Thus, Japan obviously imported large amounts of foodstuffs and industrial raw materials. The foreign trade structure in the United States was in balance with industrial goods accounting for around three quarters of both imports and exports. The import structure in the European Union was similar, whereas industrial goods accounted for more than 80% of total exports. EFTA's proportions were similar - also with a balance between imports and exports. The proportions of all reference regions and countries remained remarkably constant over time.

The graphic representation of the regional pattern of external trade in HTP makes the predominance of intra-EU-trade and EU imports from the United States very clear (Fig. 3).

The same areas predominated in EFTA imports, whereas United States imports came mainly from Japan and NICs⁶ while Japan's imports mainly came from the United States.

In the case of EU and EFTA exports, trade within or with the EU played an even greater role than in the case of imports and the United States was clearly less significant. The EU was the main customer for United States exports, while the United States was the main customer for exports from Japan, even though the EU and NICs6 were also important markets (Fig.4).

2.3 Structure of total trade by region and country

European Union

During the period studied, over half of the total EU imports of high-tech products came from outside the EU (Table 1). In 1993, 22% came from the United States, 9% from Japan, 4% from the EFTA countries and 10% from the NICs6 group, whose share had increased by an above-average amount from not quite 6% in 1989. Another 2% or so of imports came from the group of 9 newindustrialized countries, 1% from Canada, 0.4% from the state-trading countries and 0.1% each from Australia and South Africa.

The percentages show that intra-EU trade accounted for a great deal of trade in HTP and that only the United States, Japan and NICs6 were important suppliers. By 1993 the NICs6 group was already supplying more than Japan.

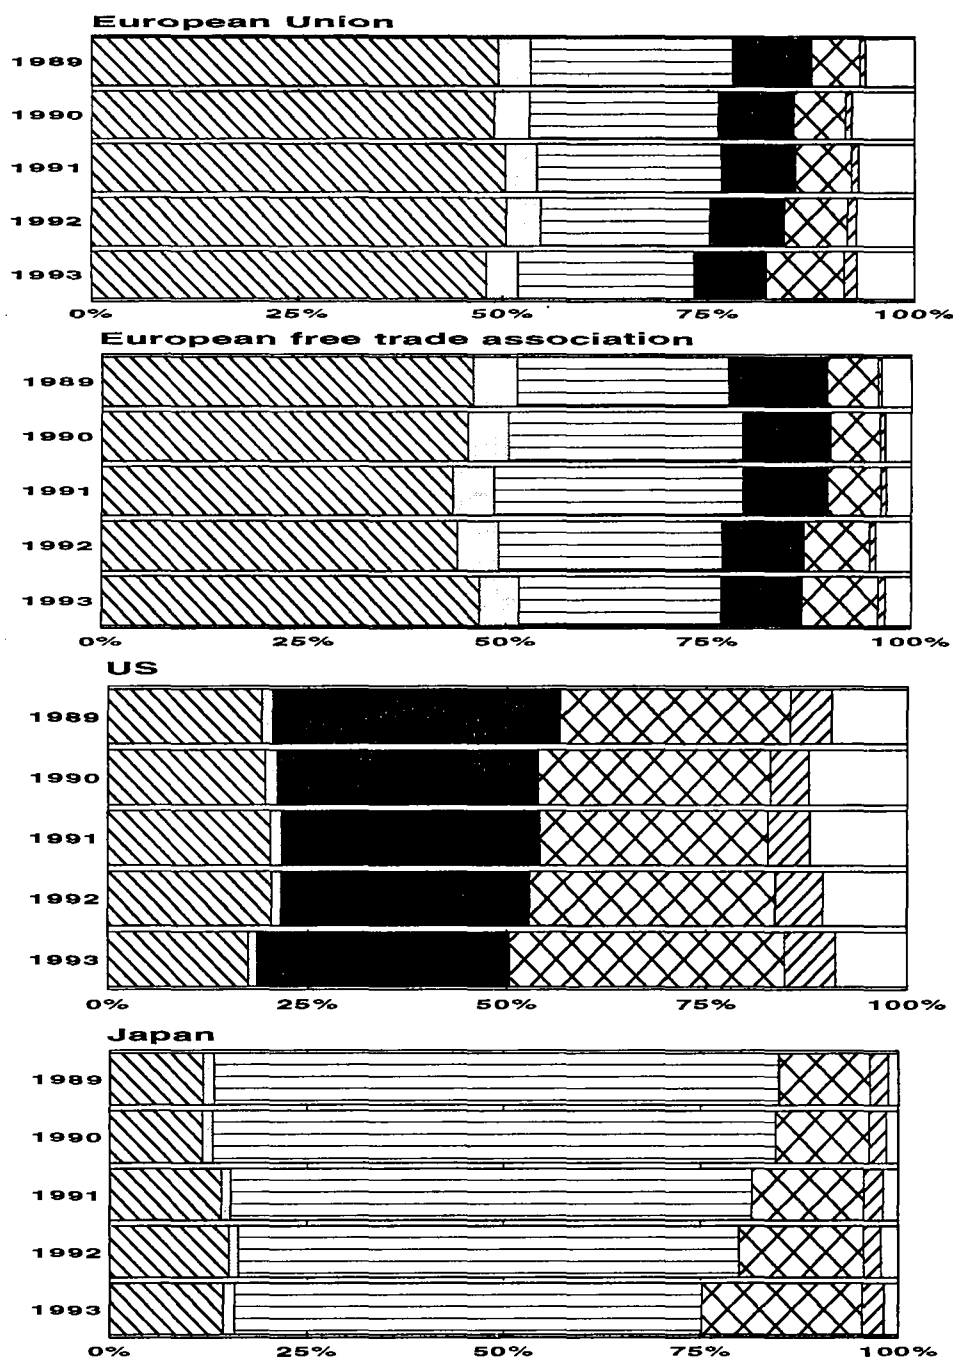

In 1992 and 1993 total HTP imports, including imports from Japan were down in each case on the previous year. Imports from the United States remained at the 1992 level while there was a marked increase in imports from the NICs6 group and the NICs9 group over the entire reference period. In 1993 both regions together accounted for some 11% of EU imports. Extra-EU imports increased over the reference period but were slightly under the 1991 level in 1992 and 1993.

On the exports side, intra-EU trade accounted for an even greater percentage. Of 45% of exports to non-EU countries in 1993, 13% went to the United States, 7% to EFTA, around 2% to Japan and 5% each to the NICs6 and the NICs9 groups. The statetrading countries (2%), Canada (1%), South Africa and Australia were of only marginal significance.

and table 3 in text

Total HTP exports by the EU rose by 13% between 1989 and 1993, with a 21% increase towards non-member countries and a 32% increase in exports to the United States. There were even greater increases in the case of other partner countries, with an increase of 95% in exports to Japan, 71% to the NICs6 group and 63% to the NICs9 group. Only EFTA remained well below the average as an export market.

Overall, the EU's HTP imports were considerably in excess of exports, both in total trade (Fig. 5) and in trade with non-member countries.

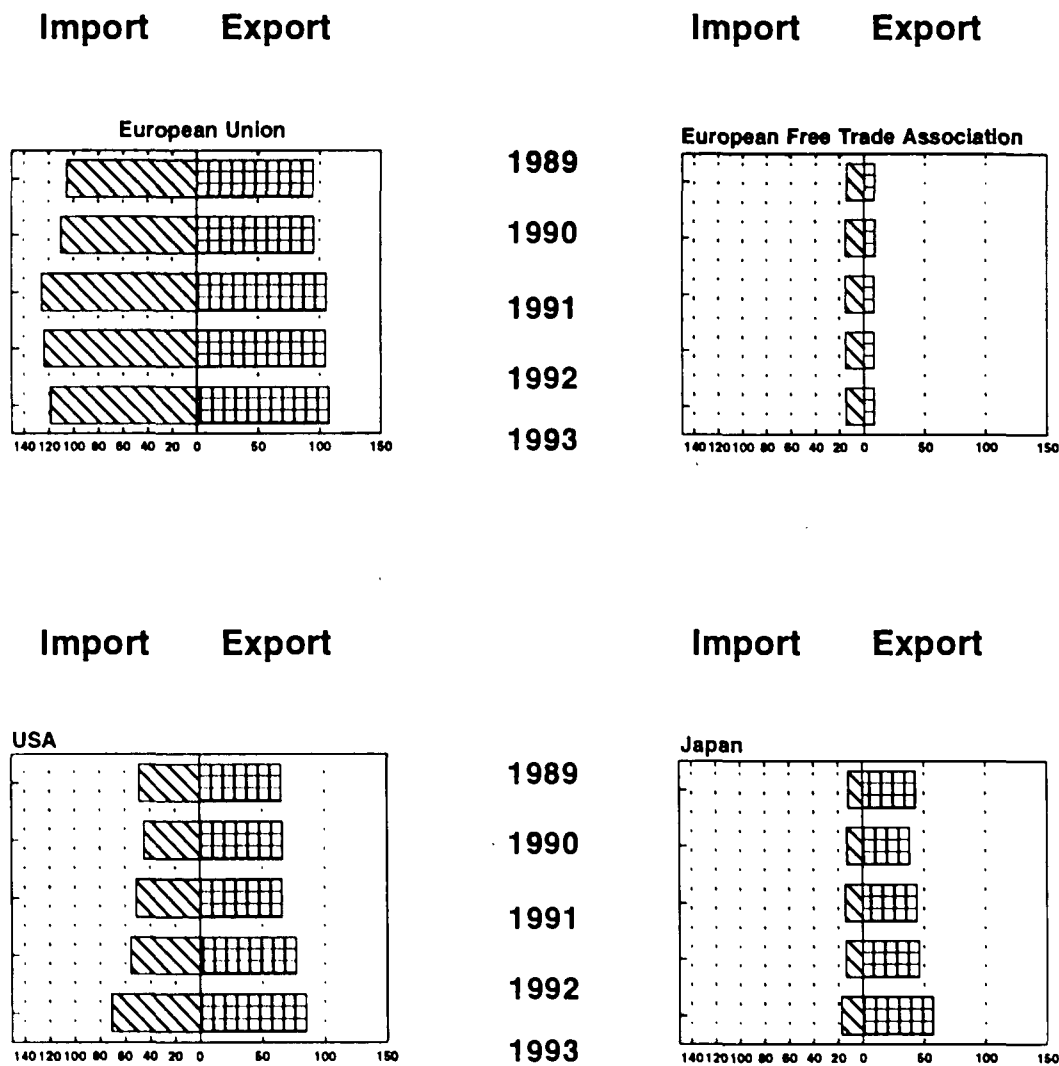

European Free Trade Association

EFTA, like the EU, is a net importer of high-tech products but with a total external trade volume (export + import) of less than one tenth of the volume of total EU external trade. The main suppliers are the EU and the United States. Japan and the NICs6 group have more or less the same relative importance for EFTA as for the EU. The EFTA HTP import figures for 1993 showed a greater concentration on the EU and a smaller share of imports from the United States. However, no trend can be deduced from this. The situation is different in the case of the NICs6 group which are constantly increasing in importance and have almost drawn equal with Japan.

The export situation in EFTA also exhibits more or less the same structure as in the EU. In the case of the United States and NICs6 group, the proportion increased throughout the reference period, while no clear trends were distinguishable in trade with other partners. This could be connected with the world-wide recession during the reference period.

Fig.5:

Development of total external trade
in high-tech products by reference countries/regions
(Bio. ECU)

USA

The regional structure of United States foreign trade in HTP differs substantially from that of European external trade. On the imports side in 1993, Japan and the NICs6 group were extremely important partners, accounting for over 30% each of the total. The European Union was substantially less important with just under 18%. The large proportion accounted for by the rest of the world comprised almost exclusively imports from Canada (9%) and from the NICs9 group (6%). Total United States imports increased by 47% between 1989 and 1993, with slight increases in the proportions accounted for by the NICs6 and the NICs9 groups, whereas imports from the European Union, Japan and Canada fell somewhat.

The EU is the biggest customer for United States exports. Its share of the total fluctuated widely over the reference period, reaching its lowest level in 1993 - a year of recession in Europe. Japan and the NICs6 group were less important customers, but the amounts imported by the NICs6 and NICs9 groups increased over the reference period. These countries have a clearly positive trade balance with both the USA and the EU and EFTA.

Japan

Europe is even less important for Japan than for the United States. Almost 60% of HTP imports in particular came from the United States in 1993, although the trend is downwards. The proportions accounted for by the NICs6 group have increased steadily in recent years, leaving the EU far behind.

On the export side, the United States is also the main partner, but the EU and the NICs6 group are substantially more important than in the case of imports, with the proportions accounted for by the NICs6 and NICs9 countries increasing. Because of the recession in 1993, the EU's share of the market fell still further in that year.

2.4 Trade structure by product groups

The previous section dealt with the main world-trade flows in HTP as a whole. The following section goes into the ten product groups in greater detail and subsequently discusses the 110 individual products or subgroups which these main groups comprise.

2.4.1 Imports

The distribution of HTP imports over the four reference regions or countries varies very widely. In 1993, the EU imported goods to the value of ECU 119 billion. This was followed by the United States with ECU 71 billion. EFTA and Japan imported substantially smaller amounts, to a value of ECU 15 billion and ECU 17 billion respectively (Table 1).

The summary set out in Table 2 and Fig. 6 shows that there were wide differences in the relative importance of the individual hightech product groups in the four reference areas, but that three groups clearly predominated in all the reference areas - aircraft, computers and office equipment, and general electronics (electronic components).

Fig.6:

Structure of HTP imports into the reference regions and countries by product groups, 1993

(in %)

Source: Eurostat; ifo Institute; Tables A 1.5 M in annex.

European Union

The European Union imported HTP goods to a value of a good ECU 105 billion in 1989, ECU 53.4 billion being spent on imports from non-member countries. By 1993, total imports had increased to ECU 118.6 billion, ECU 59.5 billion being accounted for by imports from non-member countries. The breakdown of total high-tech imports by product groups shows very clearly that the three areas mentioned above were of great importance for the European Union too, if turnover is taken as the yardstick (Fig. 6).

In the five years of the reference period, the relative proportion of total HTP imports accounted for by the individual groups largely remained constant, but there were a number of exceptions. Imports in the aircraft sector, which had accounted for around 30% of total HTP imports between 1989 and 1992, fell to 24% in 1993, probably as a result of the recession (shortage of funds).

The value of extra-EU imports of HTP increased from 1989 to 1991, but then dropped again slightly until 1993 as a result of the recession. EFTA's 4% share and Japan's 9% of slightly more remained largely constant, whereas the proportion of imports coming from the USA fell (from just under 25% to around 21%) while the market shares of the NICs6 and NICs9 groups increased.

An analysis of individual product groups by origin reveals that in some cases information on suppliers was incomplete (Table 3). This is particularly striking in the weapons sector, in which between 1989 and 1992 the European Union imported between 70% and almost 90% from non-member countries, but the origin was specified in only between 10% and 14% of cases. In 1993, the proportion of imports of non-specified origin was only 27%. In the case of nuclear energy and radioactive materials, the unexplained remainder was substantially smaller, but still very significant. The question of unidentified imports is discussed in greater detail after the comments on imports by Japan.

Unlike these two product groups, which account for only a few percent of EU HTP imports (Table 2), aircraft form the second biggest of the product groups examined. In this sector too, between 12% and 18% of imports over the period 1989 to 1993 came from unspecified sources¹.

In the case of other product groups, only a few percent of imports came from other countries not covered by this survey. In 1993 this was particularly the case with computers and office equipment, consumer electronics and scientific instruments.

1. The sources indentified were EFTA, the United States, Japan, NICs15 (6+9), the states-trading countries and Class1A countries (Canada, South Africa, Australia, New Zealand, former Yugoslavia and Europe excluding the EU, EFTA and Eastern Europe) (cf. Tables A 1.1 M and X in annex).

Source: EUROSTAT, tables A 1.2 M and A 1.5 M in annex.

European Free Trade Association

The value of EFTA imports of high-tech products increased to ECU 15.2 billion between 1989 and 1991, after which it fell back to 14.9 billion in 1992 and ECU 14.8 billion in 1993. Intra-EFTA imports were fairly constant over the reference period at between ECU 700 million and ECU 800 million per year, while imports from outside EFTA increased to ECU 14.4 billion up to 1991, only to fall back slightly in 1992 and 1993. Over the entire reference period, imports from outside EFTA accounted for 95% of the total, with the proportion coming from the EU fluctuating around 45%, between 25% and 31% coming from the United States and between 10% and 12% from Japan. The newly industrialized countries (NICs15) increased in importance and drew equal with Japan in 1993.

The main imported goods were computers and office equipment, and electronic components, both of which showed an upward trend. The importance of consumer electronics also increased somewhat. The aircraft sector decreased in importance in 1993 compared with the previous years, nor is its importance very big in view of the relatively small demand compared with other groups of products. The relatively high level of imports of weapons compared with the EU, United States or Japan suggests that indigenous production does not go very far to meeting demand (Table 2).

As with the EU, there are gaps in the identification of EFTA's suppliers in the nuclear energy and weapons sectors (Table 3). The emphasis on the United States as supplier is also very clear, particularly in the aircraft and computers groups.

Source: Eurostat, Group A1.2M Tables in annex.

United States

High-tech imports by the USA came to a total value of around ECU 71 billion in 1993. The main products concerned were similar to those in Europe (Table 2) and there was a major increase in the proportion of computers and office equipment compared with 1989. Electronic components stayed constant and there were reductions between 1989 and 1993 in the amounts accounted for by the aircraft sector and most other product groups.

For the rest, goods from the NICs (particularly the NICs6 group) occupied the leading position in the United States, even ahead of Japan (Fig. 4). This was particularly true in the most important sectors - computers and office equipment, and electronic components. Japan remained firmly in the lead in the field of consumer electronics and telecommunications. The EU's preserves were in the aircraft, Source: Eurostat, Tables A1.2M and A1.5M in annex

scientific equipment, nuclear-energy and chemicals sectors, and to a lesser extent in the weapons sector, in which the NICs9 group however occupied a strikingly important position (Table 3).

Japan

At ECU 17.4 billion, Japan's high-tech imports in 1993 were a good sixth higher than those of EFTA (Tab. 2). Since Japan's HTP exports over the same period were more than three times its imports it seems safe to conclude that Japan's total demand for hightech products, which can be assumed to be high, can largely be met by indigenous production.

Over the reference period, imports increased from ECU 11.6 billion to ECU 17.4 billion. The proportions of total HTP imports accounted for by the product groups under consideration basically remained constant, apart from fluctuations in imports in the aircraft sector, probably as a result of major supplies to Japanese airlines in individual years.

The United States is very clearly the most important supplier for Japan in all sectors except weapons. The 15 NICs are important only in the field of computers and electronics, while the EU occupied a relatively important position in the weapons, scientific instruments and chemicals sectors (Table 3).

Miscellaneous

The restriction of the number of partner companies mentioned at the beginning of this report meant that for certain reference regions or countries there is a relatively large group of other partner countries not dealt with in detail for certain product groups and certain years. These are principally the countries or regions which have not been shown separately in the tables for reasons of clarity (e.g. the statetrading countries, the classA countries, which include Canada, Australia, New Zealand and South Africa), but whose importance as suppliers or customers are mentioned on a case-by-case basis in Section 2.5 (individual products). There are also imports or exports which are included under "miscellaneous", either because they are to meet the demand for ships or aircraft or come from non-identified countries, or because the supplier or customer countries **should not** be specified, for military or other reasons. Up to 1992, these imports or exports were included in category 1090 in the economic area classification, which - from the point of view of the EU - exclusively comprises extra-EU trade. From 1993 onwards, they were recorded separately under intra-EU miscellaneous and extra-EU miscellaneous (1091 and 1092). However, the data are included in neither the intra- or extra-EU figures nor in the total import or export figures. For technical and organizational reasons it was not possible to include these retrospectively in the figures for 1993, with the result that the EU import and export figures for that year are a little too low.

In order to enable account also to be taken of the groups particularly concerned, Table 4, which contains the miscellaneous import figures for selected product groups, also shows such imports as a proportion of the total imports of the product group and the countries in which imports of this kind play a particularly important role. It will be noted that it is mainly the United Kingdom and the Netherlands which have made use of the possibility of not specifying the origin of several imports.

It should be pointed out that the miscellaneous imports or miscellaneous exports categories are also relevant to a varying extent for other reference regions or countries (EFTA, USA, Japan). However, no detailed information was available.

2.4.2 Exports

Exports by the reference regions and countries were similar to imports in that, in value terms, exports of certain product groups were clearly higher than those of others - for example, computers and office equipment. However, as expected, clear structural differences emerged, which are attributable to the different production structures - for example, the absence of Japanese-produced aircraft which would be eligible for export.

Characteristic of the overall structure is the fact that the EU was by far the total HTP export leader in 1993. The United States was well ahead of Japan and EFTA was relatively insignificant (Table 1). If only extra-EU exports are taken into account, the EU lags far behind the United States and Japan.

From 1989 to 1993, the European Union saw an increase of 13% (+ 21% if only the extra-EU figures are taken into account). In EFTA, there was an increase in 1990 followed by a reduction in 1991, which was not made up in 1992 and 1993, with the result that there was a total of reduction of 5.5% over the entire period. United States exports started to pick up vigorously in 1992 and then again in 1993 (1989 to 1993: +30.6%) while in Japan, exports fell in 1990 but increased, in some cases substantially, in 1991, 1992 and 1993, with the result that, at 32.7%, the total increase was even higher than that of the United States.

A comparison of export figures and the import figures already mentioned (cf. also Table 1) gave the following picture of trade balances for 1989 and 1993 in the reference regions and countries (ECU billion; export surplus +):

	EU total	EU extra	EFTA total	EFTA extra	USA total	Japan extra
1989	-10.6	-12.5	-5.5	-5.8	16.6	31.4
1993	-11.3	-11.8	-6.4	-6.5	13.9	39.6

European Union

Even if the European Union is a net importer of HTP, it nevertheless plays an important part in world trade as an exporter. In 1987 its position was second only to the United States where extra-EU exports were concerned (ECU 47.5 billion compared with ECU 76.7 billion), and was slightly ahead of Japan (with ECU 46 billion). The ranking had been the same in 1990 and 1991. If intra-EU exports are also taken into account, the EU is well in the lead (Table 1).

The importance of HTP exports relative to total exports and exports of industrial goods has already been mentioned. It should be pointed out that in 1993 only HTP exports increased over 1992, while total exports and exports of industrial goods stagnated. Compared with 1989, exports increased in all areas, but mainly in the case of high-tech products (+3.1% annual average for HTP, compared with +2.1% for industrial goods and total exports).

The medium to major importance of the aircraft sector, computers and electronic components and the lesser importance of all other product groups, as described above in connection with the import structure, can generally speaking be found in the export structure too (Fig. 7). However, the emphasis is clearly differs, both between exports and imports and between intra-EU and extraEU exports.

The aircraft sector accounted for a good third of total HTP exports up to 1992, with 30% in the case of intra-EU exports and 40% in the case of extra-EU exports. Only in 1993 did the figure fall to 35.5% of extra-EU export, and 30% of total exports.

The other important sector, computers and office equipment, also accounted for one third of total EU exports of high-tech products. However, it accounted for over 40% of intra-EU exports but only 20% of extra-EU exports with a slight increase to 22.5% in 1993. Thus, the emphasis was on exports to other Member States, whereas in the aircraft sector exports were mainly to non-member countries.

Table 5:

Structure of total exports by the reference regions and countries and by high-tech product groups in 1989 and 1993 (%)

Sector	Reference regions and countries

Fig.7:

Structure of HTP exports from the reference regions and countries by product group, 1993

(in %)

Source: Eurostat; ifo Institute; Tables A 1.5 X in annex.

The third important sector in terms of value, i.e. general electronics and electronic components, accounted for around one eighth of EU exports of HTP, without significant differences between intra-EU and extra-EU trade or compared with imports.

The relative importance of the various trade partners remained fairly constant over the reference period. Intra-EU export of high-tech products as a whole fell from 57% in 1989 to 54% in 1993, while the proportions going to the United States and Japan rose from 11.4% to 13.2% and from 1.2% to 2.1% respectively. Exports to the newlyindustrialized countries increased (NICs6: 3.1% to 4.7%; NICs9: 3.2% to 4.6%). EU exports to the EFTA countries fell slightly from 7.9% to 7.4% (Table 6).

The countries or regions to which the EU exports HTP vary widely according to the products concerned, quite apart from the fact that, except in the case of weapons, a large proportion of exports remain in the EU. The major customer for aircraft was the United States. In the case of computers, exports were mainly to the EFTA countries and the United States, which were also important customers for electronic components, although substantially behind the newlyindustrialized countries. The regional exports structure (Table 6) shows large proportions of non-specified countries for several product groups. As in the case of imports, these concern exports for which the destination country was not indicated. This is particularly striking in the case of weapons.

European Free Trade Association

HTP exports by EFTA were in fourth place, far behind those of the EU, the USA. By 1993 they had fallen to ECU 8.4 billion, after reaching ECU 9.0 billion in 1993 (Table 1).

The main product group in 1993 was computers and office equipment with a share of 26%, followed by electronic components, scientific equipment and machinery (Table 5). The HTP export structure did not vary appreciably over the entire reference period. However, increases could be observed in the shares of electronic components, consumer electronics and scientific equipment. The proportions accounted for by telecommunications and weapons fell. There were major differences between intra-EFTA and extra-EFTA exports in the aircraft and weapons sectors, with an increase in extraEFTA exports, whereas computers and office equipment and electronic components were more important in intra-EFTA trade. Regionally speaking, EFTA HTP exports were largely geared to the EU markets. The United States was important only in the aircraft sector but the machinery sector is also worthy of mention. Exports to the newlyindustrialized countries were mainly in the telecommunications, aircraft, electronic components and machinery sectors Table 6).

United States

In 1993, exports of high-tech products by the United States totalled almost ECU 85 billion, compared with just under ECU 77 billion in the previous year and ECU 65 billion in 1989. 29% of the total in 1993 went to the EU, 21% to the NICs6 group and 14% to the NICs9 group. A mere 9% went to Japan (Table 1). The increase in exports over the 1989-1993 period was exclusively outside the EU. Exports to EU countries fluctuated around ECU 25 billion over the reference period.

Exports were mainly in the aircraft, computers and office machinery, and electronic components sectors, where the proportions fluctuated around 33%, 30% and 20% respectively over the reference period without any clear upward or downward trends (Table 5). The proportions accounted for by all the other products groups were smaller than 5%, albeit slightly higher in the case of exports to certain regions.

In the three major areas too, the fluctuations over time were greater in the case of trade with certain countries. For example, exports to EFTA in the aircraft sector accounted for 60% in 1991, but only

Table 6:

a) World = 100%

Source: EUROSTAT, tables A 1.2X and A 1.5X in annex.

31% in 1993. The reason for this is that in certain product groups individual transactions have greater importance than in others. As regards exports from the United States to Japan, aircraft occupied a slightly below-average position, while exports related to nuclear energy were far above the average. The main exports to the NICs6 group consisted of electronic components (Table 6).

The regional distribution of US exports (Table 6) showed a clear reduction in recent years only in the case of the EU. This may be explained by the recession in western Europe over this period and does not therefore necessarily represent a lasting reduction in the importance of the EU as a market. (The maximum values, achieved in 1991 in exports to the EU and to other regions, were the result of the omission of data on exports to Canada, which accounted for between 11 and 13% in the other years).

Japan

Japan's HTP exports in 1993 were substantially up on 1992 (ECU 57 billion compared with ECU 46 billion - a rise of 24%). In 1989 the figure had been ECU 43 billion. In 1993, 40% of Japan's exports went to the United States. The NICs6 group and the EU followed with 27% and 21% respectively, while EFTA was relatively insignificant both as a customer and as a supplier (Table 1).

The most important sectors in Japan's HTP exports were computers and office equipment, electronic components and - to a substantially smaller extent - consumer electronics (Table 5). The proportion accounted for by exports of computers - a good 40% - was mainly to the United States and the EU, and the trend was upwards in both cases. The corresponding markets in the NICs6 and the NICs9 groups were relatively weak since many of those countries produce and export computer equipment themselves. The situation was different in the electronic components (general electronics) sector, which accounted for an average of around 30% of Japan's HTP exports during the reference period. Over 60% on average went to the NICs6 group and a good 40% to the NICs9 group. The United States and particularly the EU and EFTA markets were relatively unreceptive. There were no such major regional differences in the consumer electronics sector, which, however, tended to be concentrated on the EU and EFTA countries.

Japan's emphasis on the United States is not so pronounced in the case of HTP exports as in the case of imports (Table 1). Nevertheless, around two-fifths of its total HTP exports went to the United States each year throughout the entire reference period. The proportions exported to the NICs (particularly the NICs6 group) showed an upward trend. The regional distributions for exports of the various HTP groups were very clearly as follows (Table 6): the United States for weapons and computer equipment, the EU for nuclear-energy equipment, consumer electronics, computers and chemicals, and the NICs (NICs15) for general electronics, chemicals and machinery.

"Miscellaneous"

The remarks made above in connection with imports concerning unidentified countries, also apply to exports. On the one hand, there is a group of countries referred to in Section 2.5 (individual products) and on the other hand there are the miscellaneous exports, where the countries of import are not specified. Here too, of the EU countries it is the United Kingdom and the Netherlands which account for the lion's share of "miscellaneous" exports (Table 7).

Table 7:

2.4.3 Trade balance and export/import ratios¹

The trade balance (net difference between exports and imports) and the export/import quotient (exports divided by imports) are related indicators as a result of identical components being used in different calculations. An export surplus in the trade balance (export > import) results in a quotient of > 1, while import surpluses result in a quotient of < 1.

The purpose of both the indicators is to show the external trade situation of a country or region either by simply calculating the surplus or by determining the extent to which imports are covered by exports². In this study they are, to some extent extracts from the previous sections which make it possible to visualize certain structures and developments.

Both indicators have already been mentioned in the text in the summaries of the figures for the four major regions and countries (cf. Fig 1). In this section we will discuss the situation in important product groups in greater detail on the basis of examples. The corresponding indicators for individual EU and EFTA countries are discussed in Part 3, which deals with the foreign trade of these countries in HTP.

European Union

The EU's trade balance on HTP is negative, both in total trade and in extra-EU trade. During the reference period, the import surplus initially increased substantially to ECU 20.3 billion in 1991, after which it fell slightly to ECU 19.2 billion in 1992 and then sharply in 1993 to ECU 11.3 billion. As can be seen from the product groups, this surplus on imports in 1993 resulted exclusively from the situation in the three electronics sectors - computers and office equipment (import surplus of ECU 13.8 billion in 1993), electronic components (ECU 2.9 billion), and consumer electronics (ECU 1.5 billion).

There was also an import surplus on chemicals, which is initially surprising in view of the efficiency of Europe's chemical industry, but which can nevertheless be explained in terms of the selection of HTP in the chemicals sector. Noteworthy but widely fluctuating export surpluses could be observed in the aircraft and spacecraft sector (ECU 3.9 billion, telecommunications ECU 0.9 billion) and scientific instruments (ECU 1.2 billion) (Figs 8a and 8b³). The same import and export surplus structure can be seen in the extra-EU trade balance.

Further differences can be noted in the breakdown by partner. The total HTP trade balance vis-à-vis EFTA and the NICs9 group was positive (in other words there was an export surplus). This was also true of the individual product groups, with a few exceptions. The trade balance with the United States on trade with Japan on most product groups and trade with the NICs6 group in the electronics sector was almost exclusively negative.

The import/export quotients for EU external trade showed a similar picture to that of the trade balance, but from a different angle. In the case of HTP as a whole, imports were 0.9% covered by exports in 1992. The situation improved over the reference period vis-à-vis the United States and Japan, whereas there was a slight deterioration vis-à-vis the NICs6 group, which did not, however continue in 1993. Information on the development and differences in and between the individual products and vis-à-vis the various partners can be found in the relevant tables in annex⁴.

1. The data in the section are based on tables A 4.1 MX and A 4.2MX in annex.

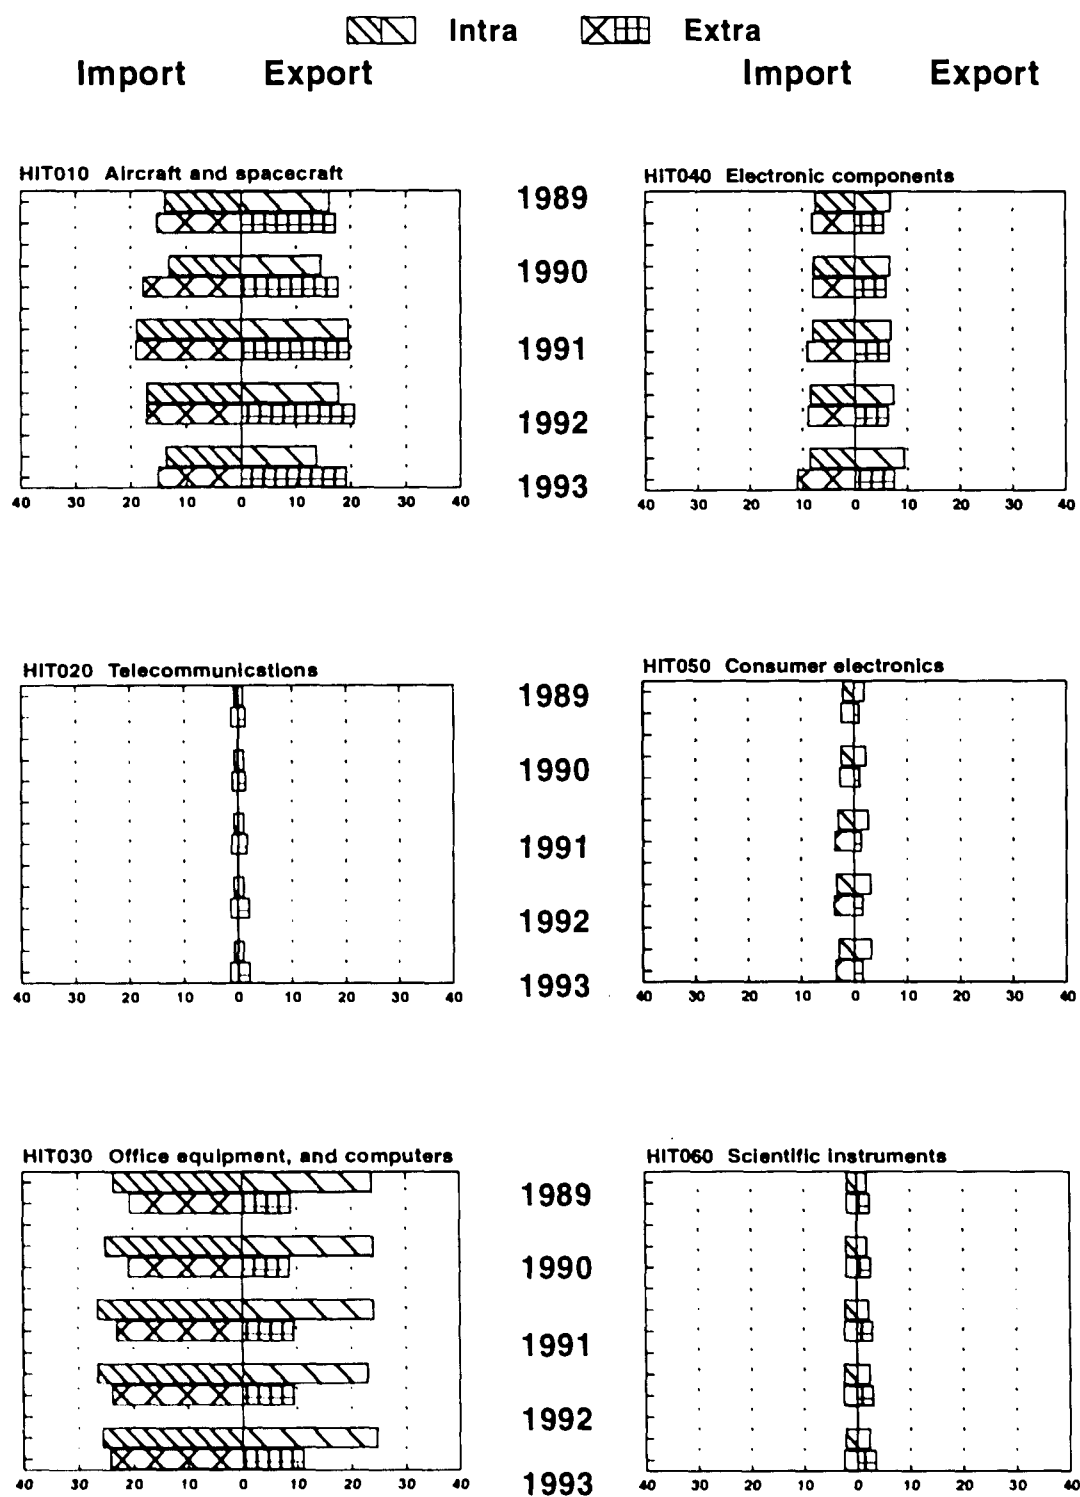

2. Generally speaking, the fact that imports are usually recorded cif (i.e. cost of goods plus cost of insurance and transport) and exports fob (costs incurred up to transshipment point) at the customs border is normally left out of account.

3. For the purpose of improved comparability, a standard unit was used for all product groups on both the import and export sides in the various reference region and countries in Figs 8a/b to 11 a/b. Because of the major differences in the trade values, the graphic representations are sometimes not very informative and in order to deal with this problem and at the same time increase the usefulness of the graphs, EU imports and exports were broken down into intra-EU and extra-EU trade. This was not done in the case of EFTA, since extra-EFTA trade is on a much smaller scale than extra-EU trade and with the unit used it would not have been possible to show intra-EFTA trade alone in any of the product groups.

4. Tables A 4.2 in annex.

Cases where there was a particularly great imbalance between exports and imports and/or the absolute figures were very low resulted in two- and three-figure quotients. If the ratios would have been 1 000 or more, they were replaced in the tables by two asterisks.

European Free Trade Association

As in the case of the EU, EFTA's HTP trade balance was negative. The import surplus increased from ECU 5.5 billion in 1989 to ECU 6.4 billion in 1993 - a good half of the EU import surplus in that year, with a total volume of external trade of only one tenth that of the EU in the same year (Table 1). The differences in volume are also shown in Figs 9a and 9b, which, for the purpose of comparability are on the same scale as Figs 8, 10 and 11 (a and b in each case).

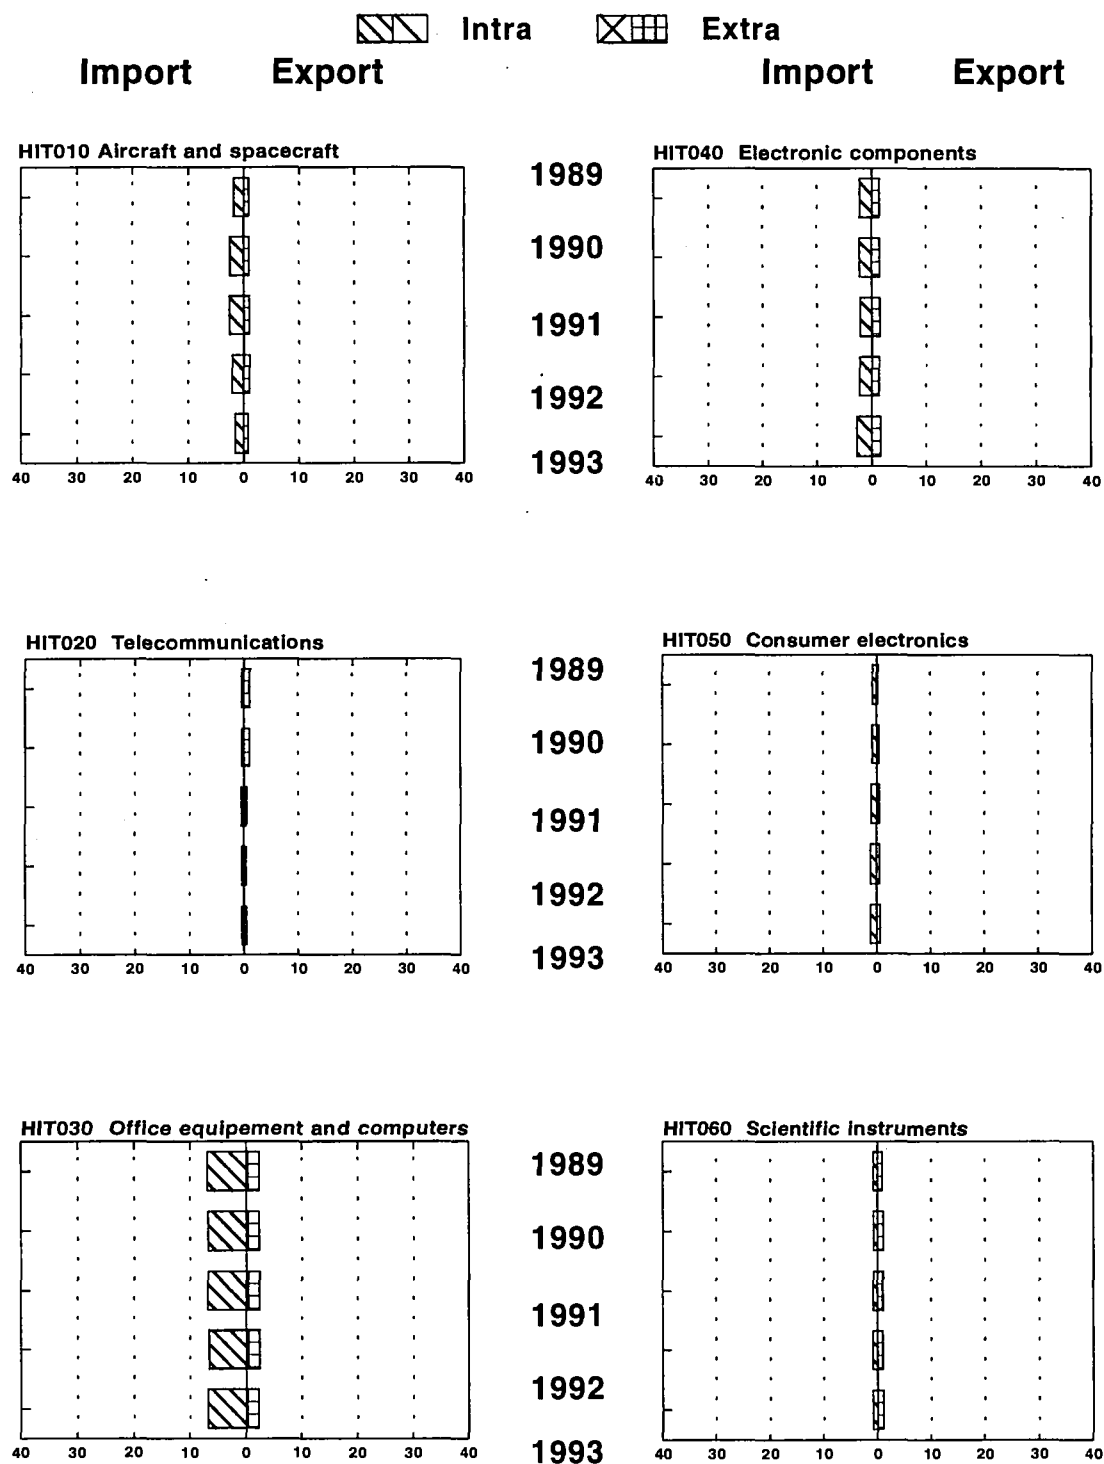

In the important product groups, imports were very much in excess of exports. These groups included, in particular, computers and office equipment, electronic components, products for the aircraft industry and consumer electronics, but the balance was also negative in the nuclear-energy and chemicals sectors. There were export surpluses in scientific energy and machinery, and in the telecommunications sector, although these were very slight in the last three years.

The total HTP trade balances were negative with all the various trade partners, except the NICs9 group, with which EFTA had export surpluses.

The quotients of less than 0.5 in many sectors and directions, and sometimes less than 0.1, as in the case of Japan, show how dominant imports are in these areas. Outliers, such as the export/import ratios with the NICs9 group in the mechanical engineering sector together with export surpluses of between ECU 45 million and ECU 96 million demonstrate, however, that the interpretation of small volumes in both directions can be questionable, since the limits beyond which the indicators cease to be meaningful have long been exceeded by then.

USA

With ECU 13.9 billion in 1993, the United States had a large export surplus, but this had fluctuated widely over the reference period (from ECU 16.6 billion in 1989 to ECU 21.1 billion in 1992). However, not all product groups or trade areas exhibited large surpluses. Generally speaking, the overall positive HTP balance resulted from export surpluses in the aircraft and spacecraft sector in all directions (ECU 13.9 billion in 1989, ECU 19.2 billion in 1992 and ECU 17.3 billion in 1993), but exports of scientific instruments, machinery, nuclear energy products, chemicals and weapons were also larger than imports. Over the period 1991 to 1993 there were major deficits in the computers sector (where there had previously been surpluses) and consumer electronics (Figs. 10a and 10b).

Japan and the NICs6 were the trade partners which supplied more than they bought. The export surpluses vis-à-vis the EU, EFTA and the NICs9 group were very substantial however.

In the United States foreign trade too, there were trade relations and product groups in which the import/export quotients were very high - in other words, where exports exceeded imports by a wide margin (there were also examples of the opposite, with quotients of 0.01 or 0.02 - for example, in trade with EFTA). Surprisingly enough, the exceptionally high quotients were with Japan and the NICs6 group, with which the United States otherwise had a deficit. However, these partners were major customers for nuclear energy technology and weapons, neither of which they supplied. (Quotients of over 1 000 were calculated in both these sectors).

Japan

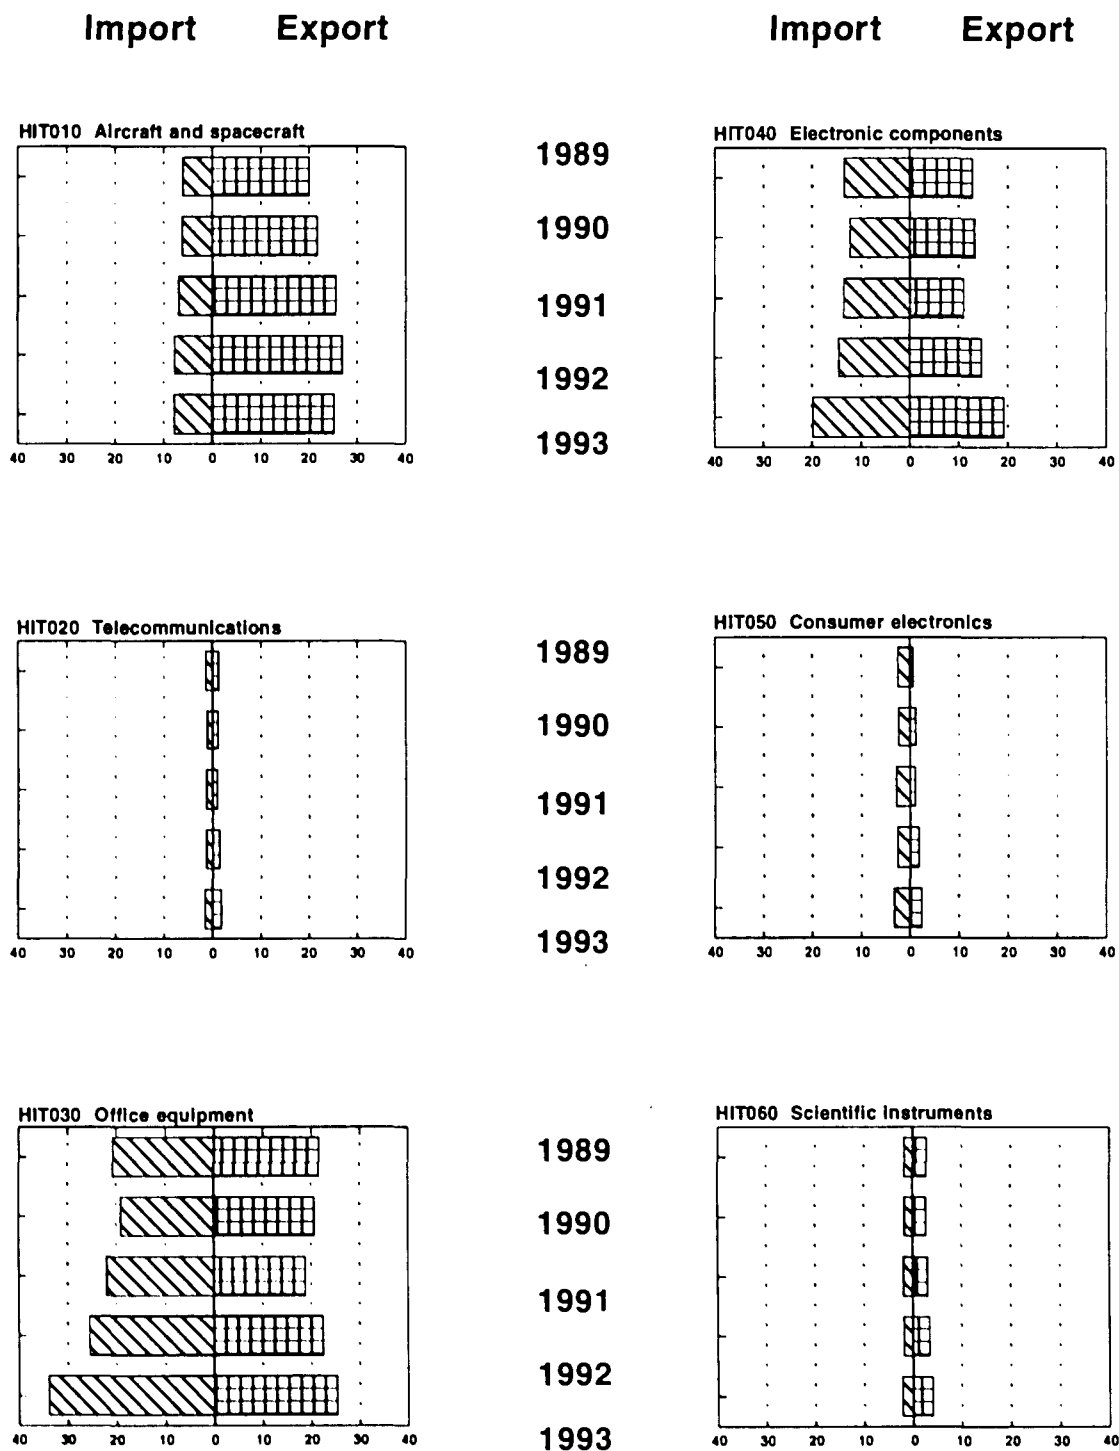

Japan had by far the highest export surpluses in the reference period, with ECU 39.6 billion in 1993. Furthermore, the figure had been rising since 1990. The major surpluses were in the three electronics groups. There were import surpluses in the aircraft and spacecraft sector, nuclear energy and - to a very small extent - chemicals and weapons (Figs 11a and 11b).

Japan's trade balance was positive vis-à-vis all partner regions and countries.

The export/import quotient for total HTP trade was relatively high vis-à-vis the EU in 1993, at 4.8, but had decreased compared with the previous year. The trade quotients with the United States were around 2, with an average value of 3 or more vis-à-vis all partners. The quotients with EFTA were lower than with the EU. Throughout the entire reference period and vis-à-vis all trade partners the quotient in the consumer electronics sector was high (two figures), whereas in the other product groups there were no outliers in individual years, nor were there any major differences in the trade relations with the individual partners.

2.4.4 Specialization index¹

The purpose of the specialization index (referred to simply as the "index" below) is to show the extent to which a country specializes in a given product in its foreign trade relative to its total trade. For this purpose, the imports or exports of a country or region in a given product area are related on the one hand to total imports by the country and, on the other, to world imports in the product area in question and world imports of goods in general. The index is calculated in the same way as the RCA (revealed comparative advantage).

Since the formula consists of two quotients, which themselves are divided, it can be expressed in the form of two variants². The possibilities for interpreting them are discussed in greater detail below. Data for the "world", which was not included as a reference region in the material for this study, were obtained for the purposes of calculating the index using the following stopgap method: "world imports" were defined as the sum of the total exports of the four major reference countries and regions and, vice versa, "world exports" were defined as the sum of the total imports of the four reference regions and countries, even though this meant that the figures for the world were a little too low.

If variant a is applied, the United States' HTP imports as a proportion of the United States total imports are compared with the world HTP imports as compared with total HTP imports. With variant b, the USA's HTP imports as a proportion of world HTP imports are compared with total United States imports as a proportion of total world imports. Both calculations lead to the same result, but an analysis aiming to explain the production and development of specialization indices must take account both of the four individual components and of the quotients in the numerators and denominators of the two formulae. No detailed analysis of this kind has been undertaken in this study.

Instead of import and export of all goods (including agricultural and mining products), external trade in manufactured products can also be taken as a reference. In this way, the contents are not so different from the HTP sector as in the case of total trade in goods. The same is true of the highest regional level. The figures for the individual countries of the EU and EFTA (Chapter 3) were related the EU and EFTA as a whole rather than the "world".

An index of 1.0 means that the shares in the numerators and denominators in the formulae have the same value, which means that there is a balance between trade in a given product and trade in goods as a whole. Indexes between 1.0 and 0.0 reflect belowaverage specialization, while values of more than 1.0 reflect above-average specialization. In other words, below-average specialization on the import side means a relatively low level of dependence on imports while above-average specialization points to a high degree of dependency. In the case of exports, indices of over 1.0 can be interpreted as a healthy competitive position, while indices of less than 1.0 reflect a weak position on the world market.

European Union

The indices for total HTP imports by the EU show that the degree of specialization remained at a very constant 0.8 or so over the entire reference period and that HTP imports were less important than total imports, from which it can be concluded that the level of dependency on supplies from abroad is relatively low.

1. The data in this section are based on tables A 4.3 M and X in annex.

2. The formula is:

Variant a: Index = $\frac{M_{ij} / \sum_j M_{ij}}{\sum_i M_{ij} / \sum_i \sum_j M_{ij}}$ = for example, $\frac{M_{HTP\ USA} / M_{all\ goods\ USA}}{M_{all\ goods\ world} / M_{all\ goods\ HTP}}$

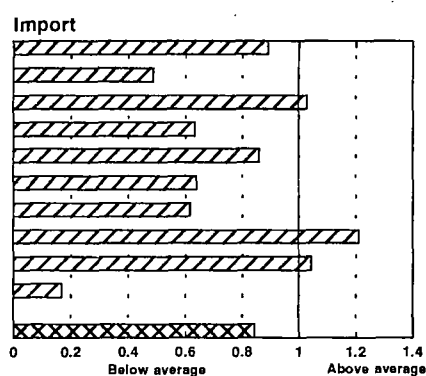

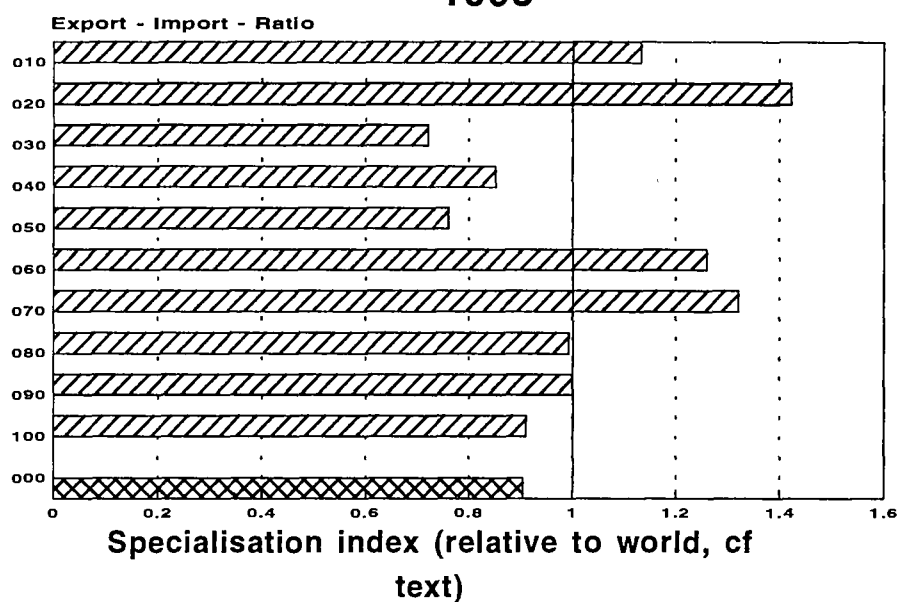

Variant b: Index = $\frac{M_{ij} / \sum_j M_{ij}}{\sum_i M_{ij} / \sum_i \sum_j M_{ij}}$ = for example, $\frac{M_{HTP\ USA} / M_{HTP\ world}}{M_{all\ goods\ USA} / M_{all\ goods\ world}}$

where M = import, i = product area, j = country/region.

Fig.12:

HIT

HIT

HIT

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A 4.4 in annex.

in the individual product groups, however, there were very wide variations, although indices of 1.0 or over were found only in the chemicals and office equipment sectors. The indices in the telecommunications and weapons sectors were particularly low.

On the export side too, the EU's level of specialization in HTP was below average and the fact that the index fell from year to year is more noteworthy than the fact that it was around 0.9% during the reference period. However, it fell in only some of the product groups while rising in others. In sectors such as aircraft and spacecraft, telecommunications, scientific instruments, mechanical engineering and nuclear-energy technology in particular, the indices were more or less clearly above 1.0. The indices for computers, components, and consumer electronics the indices were between 0.6 and 0.7, and for chemicals around 0.9 (Fig. 12).

European Free Trade Association

The degree of specialization of EFTA external trade was substantially lower than that of the EU, particularly in the case of exports (index of around 0.5 compared with 0.7 for imports). The value of the indices for imports increased gradually up to 1992, while decreasing clearly in the case of exports. In the various product groups, import specialization was usually below average except in the case of nuclear energy, chemicals and weapons. The index for chemicals and weapons rose sharply over the reference period.

EFTA exports of HTP showed below-average indexes (in some cases very much below the average) in certain sectors and indexes which were very much above the average in other sectors. The first group included aircraft and spacecraft, computers, components, consumer electronics, nuclear energy and chemicals, while the second group comprised weapons and mechanical engineering, and, to a slighter degree, telecommunications and scientific instruments (Fig 13).

United States

The United States' degree of specialization in HTP imports increased between 1989 and 1993, from slightly below-average to above-average. This means that dependency on imports increased somewhat. Particular increases could be observed in the field of computers and electronic components, whereas imports became less important in the field of consumer electronics. Dependency on imports was particularly low in the case of weapons, aircraft and spacecraft and chemicals.

High total values of over 2.0 were particularly encountered in the case of exports of weapons (around 12.0). However, the USA exhibited a strong position on the world market in other sectors, i.e. aircraft and spacecraft, electronic components, scientific instruments and machinery, to give a few examples. The only below-average sector up to 1992 was consumer electronics (Fig 14).

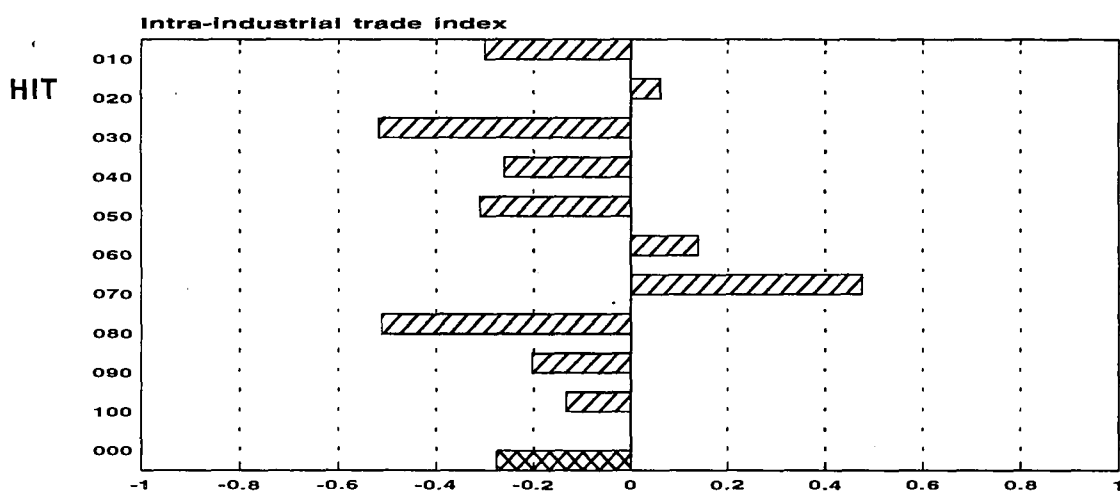

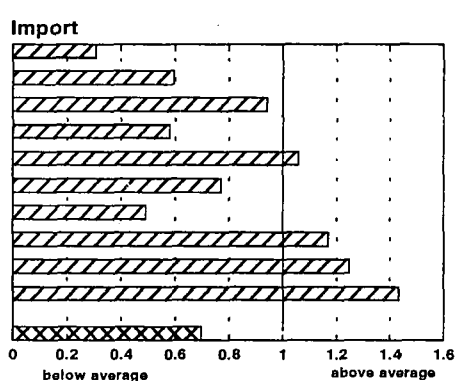

Japan

Japan clearly had a below-average level of specialization in imports and a above-average level of specialization in exports in its foreign trade in HTP. However, there were major variations from one product group to another.

Fig.13:

External trade indices Reference region: EFTA

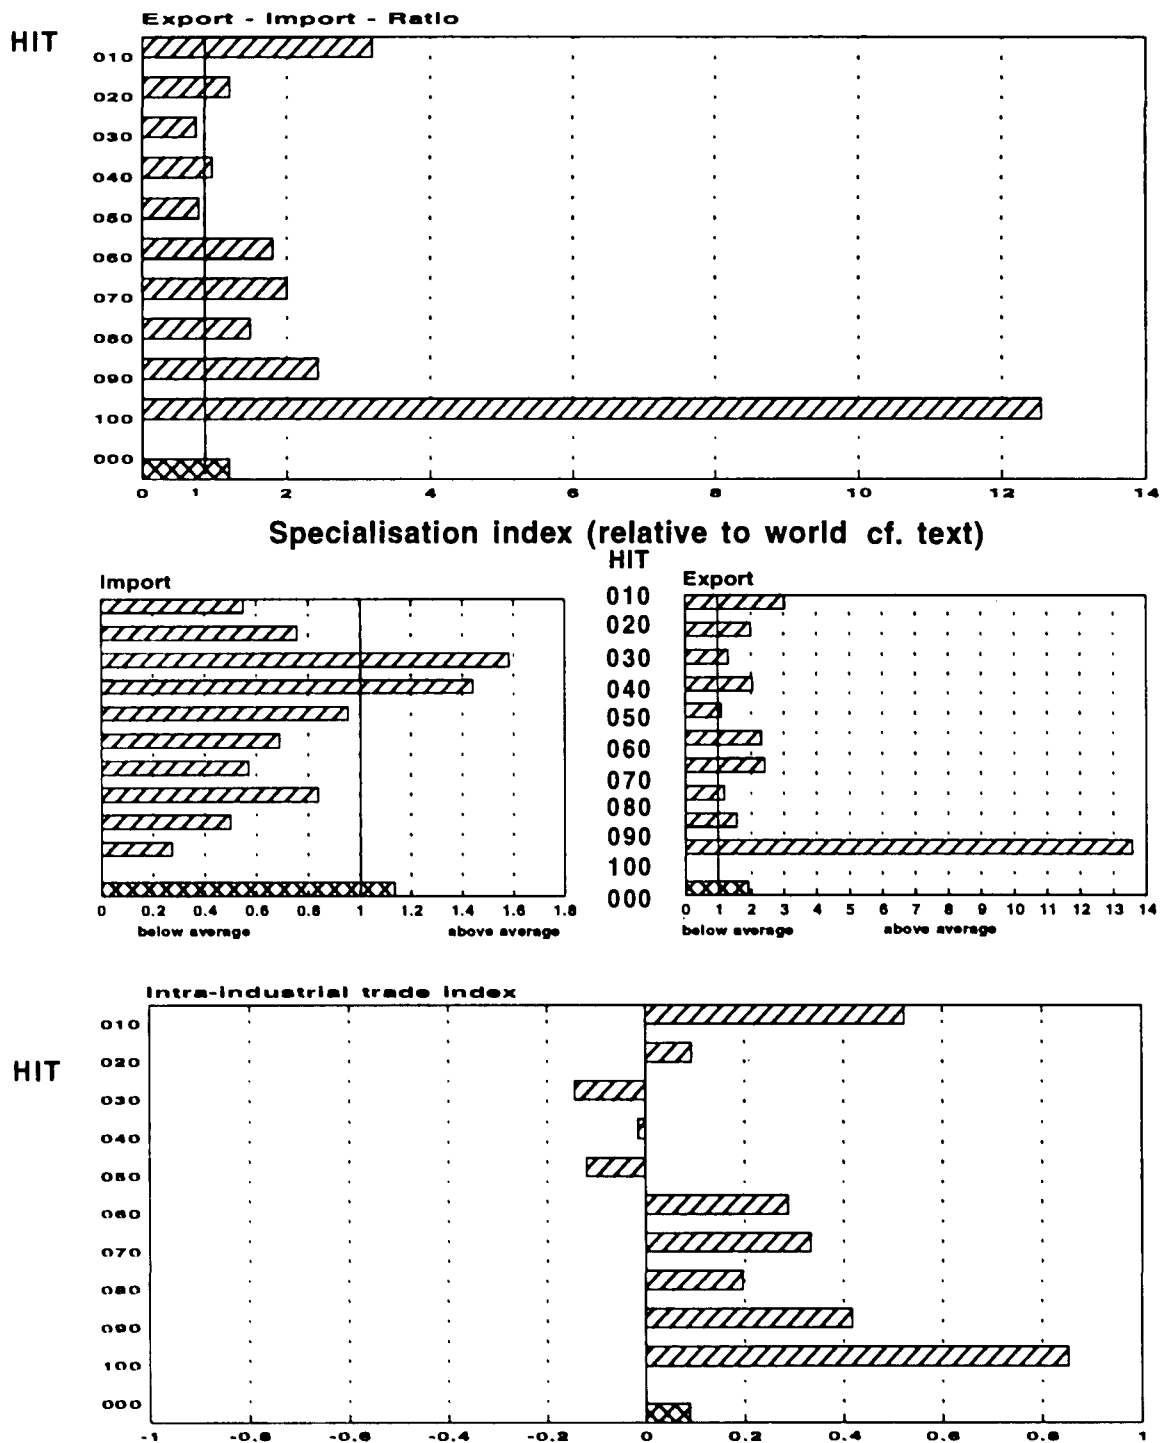

1993

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A 4.4 in annex.

Fig.14:

Foreign trade indices **Reference country: United States** **1993**

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A 4.4 in annex.

Japan's dependency on imports was above average only in the nuclear technology and chemicals sectors. In all other areas, including aircraft and spacecraft, in which Japan's own production is in its infancy, the indices were mostly very much below average.

Exports were in sectors with very high indices, i.e. telecommunications, consumer electronics, electronic components, machinery, computers and scientific instruments, whereas sectors such as aircraft, nuclear energy and weapons were practically of no significance for exports, with indices of between 0.1 and 0.0 (Fig. 15).

2.4.5 Intra-industrial trade index¹

The intra-industrial trade index is an indicator of the scale of trade in a particular product area (e.g. HTP as a whole or individual product groups) between two trade partners (e.g. EU and United States). If, for example, the EU supplies the United States with microelectronic components to the same value as it buys from the United States, the level of intra-industrial trade is the highest possible, corresponding to an index of zero. The extremes range from + 1.0 for "export only" to - 1.0 "for import only" as the elements in the formula show this index relates to one country and one product group only and represents the external trade balance divided by the external trade volume, unlike, for example, the specialization index, the calculation of which includes higher levels in regional and product terms.

The way in which certain values of the intra-industrial trade index should be assessed, is a question of economic or external-trade policy. Generally speaking, however, the closer the index approaches zero, i.e. as the level of intra-industrial trade increases, the more advanced, and indeed similar, the degree of industrialization of the partners. It can be seen from experience that similarly developed industrial countries are best placed to complement each other in the goods they manufacture and to identify and exploit market niches, while at the same time compete for market shares by means of an aggressive selling-price policy, while maintaining comparably high quality.

European Union

The European Union provides examples of this. Overall, the EU's total trade in HTP exhibited a high level of intra-industrial trade (abbreviated to "trade level" below). The indices were between 0.0 and - 0.1. There were major variations in the relations with different trade partners. The trade level was clearly higher in intra-EU trade, reaching 0.0 or + 0.0 in 1990 and 1993, which means that minor import or export surpluses fell below the rounding threshold. Substantially smaller, although still relatively high, was the trade level with non-member countries. However, there was a balancing effect, since the relatively high indices for trade with the United States, Japan and the NICs6 group were negative while they were positive for trade with EFTA and the NICs9 group. This means that in the individual trade directions the levels were very low in some cases (e.g. Japan) - a phenomenon which was even more noticeable in the individual product groups.

1. The data in this section are based on tables A 4.4 MX in annex.

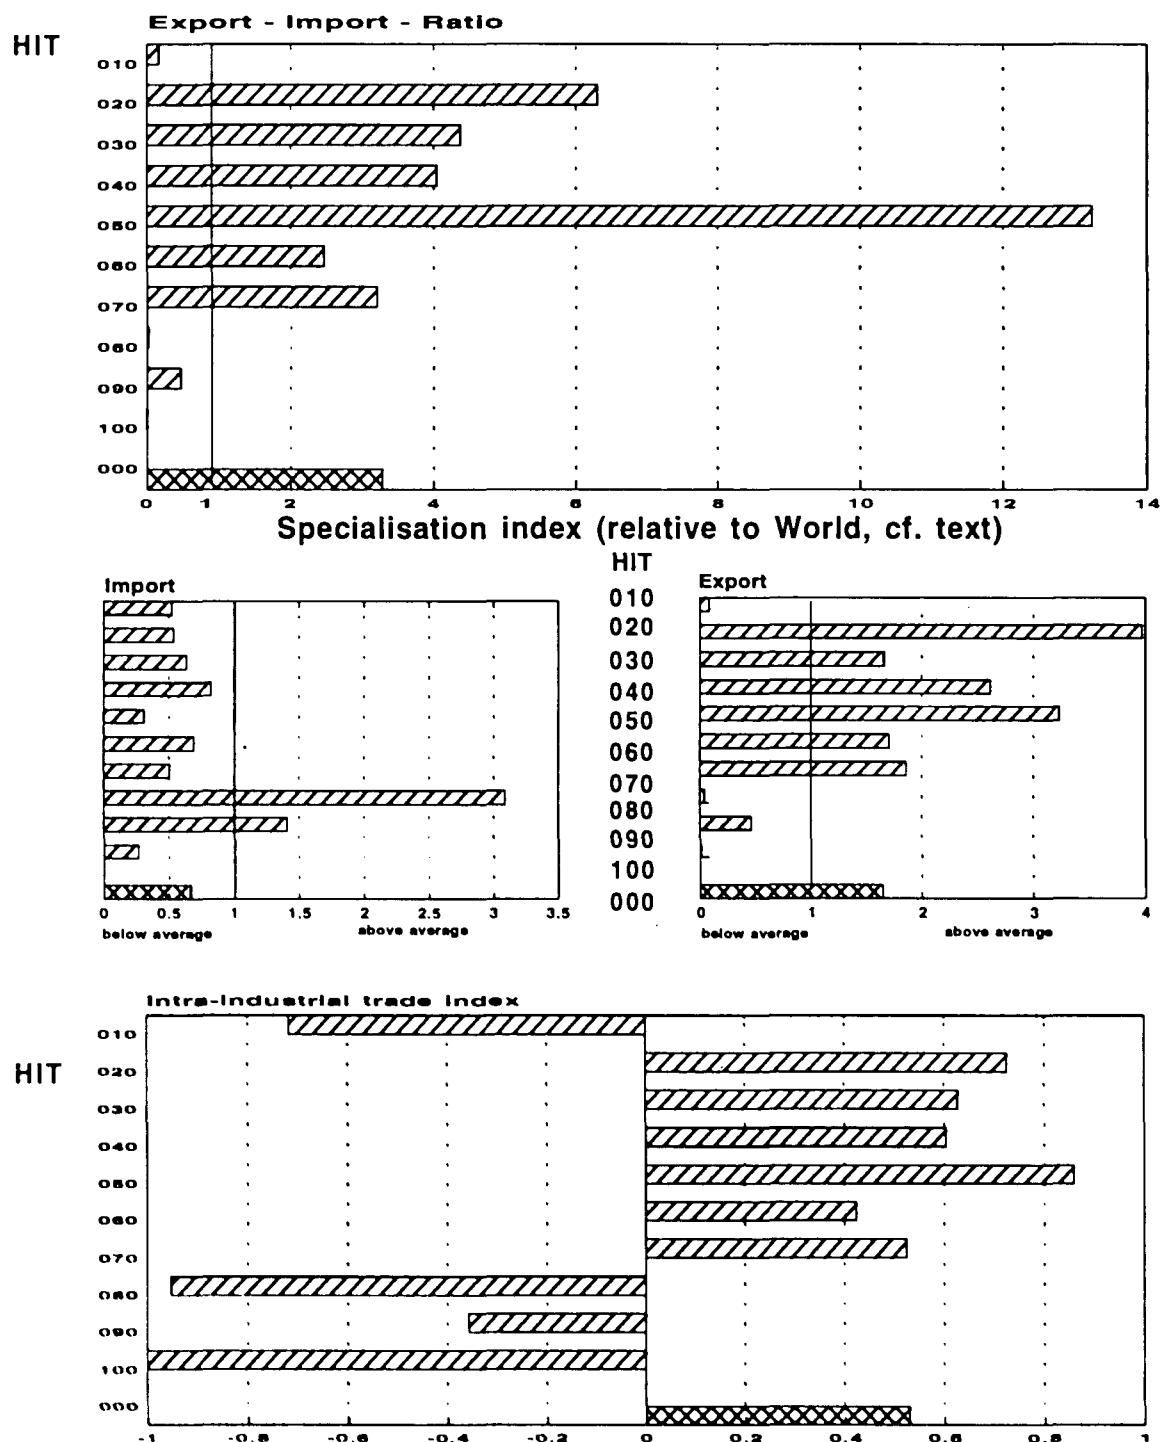

2. As a result of rounding, values of 1.0 can also be obtained if imports or exports are on a small scale (+ 1.0 or -1.0 respectively)

3. The formula is:

$$\text{Index} = \frac{\text{Export}_{ij} - \text{Import}_{ij}}{\text{Export}_{ij} + \text{Import}_{ij}} = \frac{\text{Balance}}{\text{volume}}; i = \text{product group}, j = \text{country/region}$$

Fig.15:

Foreign trade indices **Reference region: Japan** **1993**

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A 4.4 in annex.

EU trade with Japan, therefore, was extremely unbalanced in the majority of the product groups, on both the import side (surpluses in telecommunications, computers, components, consumer electronics) and on the export side (surpluses in nuclear energy and weapons). In the case of intra-EU trade, high or very high levels could also be observed in most product groups. The levels were somewhat lower in the case of trade with EFTA, while levels of trade with the United States were much lower still overall, even though levels in certain groups were relatively high (scientific instruments, nuclear energy).

European Free Trade Association

EFTA had relatively high negative values for HTP trade as a whole and for the average of all trade partners. In other words, the trade level was not very high and imports exceeded exports. The most favourable situation was in intra-EFTA trade, and the indices for trade with the EU also indicated a substantially higher level than for total external trade. There were particularly low negative values in the case of trade with the United States, Japan and the NICs6 group.

The relatively low trade level, mainly negative, was also to be found in all the product groups, except that in individual cases (particular product groups, partner country or year) extreme values of - 1.0 or + 1.0 or just slightly less were reached, while in other cases the index was near to 0.

United States

With an index of 0.1 to 0.2, the United States' intra-industrial HTP trade was at a relatively high level, if not quite as high as that of the EU and largely resulting from balancing effects. The export surpluses with the EU, EFTA and the NICs9 group were large while the import surpluses were large with Japan and - to a lesser extent - the NICs6 group.

The situation varied greatly within and between the individual product groups, not only because the indices were sometimes positive and sometimes negative, but also because the levels varied from very high (computers and electronic components, although there were balancing effects) to very low (weapons), or fluctuated over the reference period (consumer electronics).

Japan

With a positive index of over 0.5 for the entire reference period, Japan's trade level was clearly lower than that of the other reference regions or countries. The indices for trade with all partners were positive, which means that there were no balancing effects.

However, there was a very clear balancing effect between the individual product groups, with almost -1.0 in the case of both weapons and nuclear energy, -0.7 for aircraft and spacecraft, and -0.4 for chemicals, while all other sectors had positive indices, which were usually high. At the detailed level, the indices for Japan's foreign trade in HTP were also usually high. Exceptions were trade with EFTA and scientific instruments and machinery, where the indices were low and the trade levels high.

2.5 Trade structure by individual product¹

The following description of the trade structure by individual product or group deals with the more important items within the groups, the proportions they account for, their development over the reference period and the trade partners. A discussion of exports follows directly on from the account of imports in order to facilitate recognition of the relevance of certain products for the external trade

1. The data commented on in this section can be found in tables 2.1 to 2.10 in the annex (A2.2-2.10, M and X), in so far as no reference is made to tables in the text (excluding A).

of a given reference region or country. The basic approach adopted for this study, i.e. commenting on external trade by reporting region or country, also underlies this chapter.

European Union

Aircraft and spacecraft

The aircraft and spacecraft group comprises 16 individual items, accounting for total EU imports of ECU 28.8 billion in 1993. The major item, with ECU 15.4 billion in that year, was aircraft with a total unladen weight of over 15 t, 58% of which came from intraEU trade and 23% from the United States. Second place was occupied by aircraft with an unladen weight of between 2 t and 15 t, accounting for ECU 4.9 billion. In this case, imports from other countries of the EU accounted for 45%, 16% and 9% respectively coming from the United States and EFTA countries. Together with light aircraft (unladen weight of less than 2 t) and helicopters, this group accounted for 71% of the total ECU 28.8 billion in 1993. Jet and turboprop engines and components accounted for 23% or ECU 6.6 billion in 1993. The United States was the main supplier.

The other products and product groups - radar and other navigational equipment, propellers and rotors, flight simulators - were unimportant in terms of value. The majority of these items were also imported from other EU countries or the United States. The proportions imported from other countries (e.g. Canada) were also relatively large in many sectors. These included imports of unspecified origin.

In 1993 the EU exported aerospace products to the value of ECU 32.6 billion - a good 10% more than imports in the same year. Aircraft of all weights accounted for 71% of the total exports in the group, 52% alone being accounted for by aircraft with an unladen weight of over 50 t. Exports in the engines sector were also important, particularly jet engines with over 25 kN thrust and engine components. This entire product group accounted for 21% in 1992 with the import value only slightly higher than the export value, at ECU 6.9 billion.

A good 40% of the total exports in the group as a whole remained within the EU during the reference period. The USA was also an important market, particularly for large jet engines and engine components.

Telecommunications

The telecommunications sector comprises five individual subsectors accounting for a total import value of ECU 2 196 million in 1993. These imports comprised various types of equipment, of which telegraphic equipment accounted for the largest proportion, with ECU 1 042 million or 47%, followed by carrier-frequency systems with 27% and telephone switchgear with 15%. 41% of the telegraphic equipment came from Japan and a quarter from intra-Community trade, whereas switchgear and carrier-frequency systems were primarily EU or USA imports respectively. The other items in this product group, i.e. test equipment and optical fibres were relatively insignificant.

EU exports of telecommunications products totalled some ECU 3.1 billion in 1993, with a very clear export surplus. Unlike in the import structure, exports of telephone and telegraphic switchgear were in the lead with 41%, followed by carrier-frequency systems with 26%. The other product subgroups accounted for around a tenth each.

Telegraphic equipment and electrical test equipment for use in communications were clearly concentrated in intra-Community trade. In the case of the other products, other countries were relatively important markets, including the former state-trading countries.

Computers, office equipment

The electronic and data processing group comprises ten individual items, which accounted for a total value of imports into the EU of ECU 49.7 billion in 1993. The most important items were computer components, with 30%, followed by CPUs with 18%, i/o units with 20% and storage units with 14%. Complete PCs and photocopying machines accounted for only 6% or 4%. Intra-Community trade was predominant in the entire group and in all individual subgroups. Other important suppliers were the USA, Japan and the NICs6 group, although the emphasis was on different products in each case. The NICs6 group were particularly important suppliers of storage units, I/O units and complete PCs.

The computer sector was the second most important sector of EU HTP exports in 1993, accounting for a value of ECU 35.8 billion. The most important sub-sectors were computer components (33%), CPUs (27%) and I/O units (16%). Storage units and complete PCs were substantially less important with 9% and 5% respectively. IntraCommunity trade predominated not only in exports in the entire product group, but also in all the individual sub-sectors.

Computers and office equipment were the areas in which there was constantly a clear import surplus.

Electronics

The general electronics group mainly comprises electronic components, but also such things as X-ray tubes and automated control systems. It comprises 21 individual items with an EU import value of ECU 19.6 billion in 1993. The total increase over 1989 was 25%. Two individual items clearly predominated - integrated circuits, with a share of 64%, and printed circuits with 8% in 1993. These were followed by automated control systems (5%) and capacitors, transistors and diodes with around 3% each.

As in the computers group, intra-EU trade predominated, accounting for a good 40% of all imports. It also took the lead in the majority of individual items. Here too, other important suppliers were the United States, Japan and the NICs6 group. However, attention should be drawn to a particular trend in this connection. With a share of 2% of the total, the LC and LED display sector still accounted for a very small proportion of the total. However, the import value increased from ECU 67 billion in 1989 to almost six times that amount (ECU 394 billion) in 1993. Supplies from Japan increased over 15-fold over the same period, with the result that 61% of imports came from Japan in 1993. Over the reference period, Japan became the world-market leader in an area which still has a great commercial potential before it.

In the large sub-sector of integrated circuits and micro-components imports from the USA, Japan, EFTA and the NICs15-group increased by 42% in 1993 compared with 1992, with a 48% increase in imports from the USA and a 61% increase in imports from the NICs6 group.

In 1993, the EU exported electronic components to a value of ECU 16.7 billion. Like computers, this is a product group in which the EU imports more than it exports, if only slightly. In 1993, imports of electronic components were 17% above exports, this figure being 39% in the case of computers.

With 59%, electronic integrated circuits and microcomponents were the most import subgroup, but printed circuits (7%), switchboards (8%) and automatic control systems (8%) were also fairly important. The main countries to which products from the entire group were exported were other EU Member States, with major exceptions in 1993 being microwave tubes (USA) and transistors and diodes (NICs6 group).

Consumer electronics

In 1993, the EU imported consumer electronics to a total value of ECU 6.4 billion. The sector comprises only four sub-sectors, of which CDs and CD-ROMs are the most important, accounting for 59%, compared with 27% in the case of video cameras. The remaining two groups are CD-players and

Consumer electronics

In 1993, the EU imported consumer electronics to a total value of ECU 6.4 billion. The sector comprises only four sub-sectors, of which CDs and CD-ROMs are the most important, accounting for 59%, compared with 27% in the case of video cameras. The remaining two groups are CD-players and video recorders which do not operate with magnetic tape. The most important region of origin was the European Union, with Japan occupying a dominant position in the case of video cameras (72%) and the United States supplying a quarter of the total CDs and CD-ROMs.

The EU's exports of consumer electronics totalled ECU 4.8 billion in 1993. There was a substantial steady increase over the reference period, but this did not alter the fact that in this sector too there was an import surplus. Around three quarters of exports in 1993 comprised CDs and CD-ROMs and a further 10% comprised television and video cameras. The main markets for CD and CD-ROMs were in the EU and EFTA, while only the EU was an important market for cameras.

Scientific instruments

This product group comprises 22 subgroups and includes scientific, medical and optical instruments and prostheses. The total value of imports into the EU in 1993 was ECU 4.6 billion. Various individual items can be taken together in larger groups - e.g. particle accelerators, glass fibre and glass fibre cable (not for data transmission), optical instruments and components, lasers, electro-medical diagnosis instruments, prostheses, hearing aids and pacemakers, radiological equipment, spectrometers, etc. (use of optical rays, measurement of ionized rays, cathode-ray oscilloscopes).

Radiological equipment (28%), instruments for medical diagnosis (17%), prostheses (14%), hearing aids and pacemakers (9%), and spectrometers (6%) accounted for substantial shares of the total EU import value. Intra-Community trade was predominant in the case of X-ray equipment, but there was also a substantial volume of imports from the United States. EFTA countries were important suppliers of alpha, beta, or gamma radiation equipment for non-medical purposes, but this is a relatively small product group overall. EU countries, the United States and Japan were the main suppliers of electro-medical diagnosis equipment, while EU countries, the United States and EFTA predominated in the case of prostheses. In addition to EU countries, EFTA and the NICs⁶ group were important suppliers of hearing aids. The main suppliers of pacemakers were the EU, the United States and EFTA.

The high-tech section of the scientific instruments sector exhibited a constant export surplus of around one tenth throughout the reference period up to 1992. 1993 exports totalled ECU 5.8 billion. Since imports fell in that year, the export surplus increased sharply to 25%. The most important individual products were X-ray equipment with a share of 26%, and alpha, beta and gamma radiation equipment and other products in this group, accounting for a total of 19%. Other important products in the medical sector were electro-medical diagnosis equipment with 13%, and prostheses with 9%. Hearing aids and pacemakers accounted for 6% of exports.

The main markets for exports of radiological equipment were the EU, the United States and the group of "other countries" including the former state-trading countries and overseas industrialised countries (Australia, Canada, South Africa), accounting for a total of nearly 10%. Intra-Community trade was even more important in the case of electromedical diagnosis equipment, prostheses, hearing aids and pacemakers.

Mechanical engineering

The mechanical engineering group comprises 11 subgroups including gas turbines and components, laser-controlled machine tools, transfer equipment, numerically controlled machines and honing,

lapping and welding machines. With a total value of ECU 3.2 billion in 1993, the entire group was one of the smaller HTP import groups in the EU. Imports had dropped by 14% compared with 1992, before which they had increased in 1989 (ECU 2.9 billion).

Gas turbines (up to 5 000 kW, over 5 000 kW and parts for gas turbines) were by far the most important item in the group, with a share of 71%. Laser-controlled machines and transfer equipment were also important, with shares of 11% and 8% respectively. Gas turbine imports came from EU Member States and the United States. Most machine imports came from the EU and the EFTA countries.

Imports from the United States in 1993 were substantially up on the levels for 1989 and 1992, mainly because of imports of gas turbines and laser-controlled machine tools. After 1990, there was a dramatic reduction in imports of transfer equipment, of which Japan is a major supplier, probably partly because of the reduction in investment in EU industry.

HTP imports and exports by the EU in the mechanical engineering sector have been more or less in balance in recent years, but in 1993 imports fell and exports increased to ECU 4.2 billion. Three quarters of this was accounted for by gas turbines and gas turbine parts. Transfer equipment followed with 8%. Exports - including exports of the individual products and product groups - mainly went to EU Member States.

Nuclear energy

The nuclear-energy group comprises two sections - fuels and fuel elements on the one hand, and plant and equipment on the other. Where the total value of ECU 2.3 billion in 1993, imports of these products did not account for a major share of total EU imports of high-tech products.

With a share of 58%, the major import items were enriched uranium and plutonium, 67% of which came from EU countries, and non-irradiated fuel elements, with a share of 25%, almost all of which came from within the Community. With a share of 14%, natural uranium was the third most important product group, coming primarily from other, non-specified countries (including South Africa and Australia).

Nuclear energy was another high-tech area in which the EU regularly managed to achieve a certain export surplus up to 1992, while exports and imports were in balance in 1993, with exports totalling some ECU 2.3 billion. As in the case of imports, the most important individual items were enriched uranium and plutonium, with a 63% share. Second place was occupied by non-irradiated fuel elements, with a share of 23%.

Half of the exports of enriched uranium went to EU countries, and a fifth to other countries, whereas only EFTA was an important export market for fuel elements outside the EU.

Chemicals

In accordance with the harmonised system, only various elements, isotopes and rare-earth compounds were included as high-tech products of the chemical industry, together with hormones and the synthetic material, polyethylene terephthalate (PETP). Consequently, this group is relatively insignificant in terms of value, with total EU imports of ECU 1.6 billion in 1993.

The most important individual item in 1993, with a share of 46% was hormones, followed by PETP (28%) and radioactive elements and isotopes (16%). IntraCommunity trade predominated in almost all individual sectors, accounting for over 50% of total imports. Exceptions were the rareearth metals

(in elemental form) and non-radioactive isotopes. Other relatively important sources of supply were the United States, Japan and, in certain cases, the EFTA countries and the NICs group.

Up to 1992, imports were substantially higher than exports, whereas a balance was achieved in 1993, with exports totalling ECU 1.6 billion. The most important items were hormones (43%), PETP (28%) and radioactive elements and isotopes (19%). The main markets were the EU, EFTA and the group of other countries.

Weapons

The weapons group comprises only three items - tanks and armoured cars, bombs, grenades, torpedoes and other heavy ammunition, and a group of non-specified military weapons. With a 90% share of the total import value of ECU 259 million in 1993, ammunition was the only important individual item.

The origin of weapons imported into the EU is largely unspecified, but intra-Community trade plays an important part. However, it must be assumed that the vast proportion of international trade in weapons, particularly heavy arms, does not show up in external or foreign trade statistics. Imports increased substantially from 1989 to 1991, but dropped back in 1992 and 1993, presumably as a consequence of the relaxing of international tensions and cutbacks in defence spending.

The EU's HTP exports in the weapons sector totalled ECU 236 million in 1993. This meant that the import/export situation was in balance. The only important export item was heavy ammunition, and the export destinations were in most cases not indicated.

European Free Trade Association¹

Aircraft and spacecraft

EFTA imports of products in the aircraft and spacecraft sector totalled some ECU 1.5 billion in 1993 - somewhat down on the ECU 2.5 billion of previous years. With a share of almost 48% in 1993, aircraft with an unladen weight of over 15 t were the most important item. These, together with smaller aircraft, accounted for a total share of 60%. With a share of 20% in 1993, the engines sector - jet and turboprop engines, and, in particular, components - were important, but there were fluctuations over time in both sectors. Over the reference period, the engines sector declined only slightly, because of the importance of components. Imports of aircraft, on the other hand, fell from ECU 1.846 billion in 1991 to half that figure in 1993, thus ending up substantially lower than in 1989.

The main supplier of large and medium-sized aircraft was the USA, ahead of the EU. In the engines sector, the situation was similar except in the case of large jet engines (with over 25 kN thrust), which came predominantly from the EU. Radar equipment and helicopters, both of which accounted for only a small proportion of the import value, were primarily supplied by EU countries.

EFTA exports of aircraft and spacecraft were substantially lower than imports over the entire reference period. Indeed, the export value was usually less than half the import value, which is not surprising in view of the production structure of these countries. In 1993, exports totalled ECU 806 million - the

1. The subdivision of the product groups into a given number of sub-groups remains constant for all the reference regions and countries and will therefore not be dealt with specifically in the rest of this section.

lowest value in the entire reference period - but only wide fluctuations can be identified, rather than any clear upward or downward trends.

Aircraft accounted for 57% of total exports in 1993, and products from the engines sector, particularly components, accounted for 29%. The extent to which re-exports are involved in the case of supplies of aircraft cannot be determined from the figures available. However, it is plausible that EFTA countries (and many EU countries) are important as producers of parts. With a share of 10%, radar and other navigation equipment had a certain importance.

The main markets for EFTA exports were the United States and the EU, both in the sector as a whole and in most of the subsectors. The radar equipment sector was an exception in that the NICs countries were also important markets in addition to the EU, albeit with wide fluctuations over time.

Telecommunications

In the telecommunications sector, EFTA imports over the reference period tended to fluctuate around ECU 400 million. The most important import item in 1993 was telegraphic equipment, with 37% of the total ECU 403 million, followed by carrierfrequency systems with 27% and telephone switchgear with 23%.

The major suppliers were Japan in the case of telegraphic equipment and the EU in the case of telephone switchgear. In recent years, carrierfrequency systems have come in almost equal proportions from Japan, the EU and the United States. The other items - test equipment and glassfibre cable - were relatively insignificant.

Exports fell dramatically over the reference period, from ECU 1 066 million and ECU 1 042 million in 1989 and 1990 to ECU 451 million and ECU 426 million in 1991 and 1992. The figure in 1993 was ECU 456 million. This was primarily due to the telephone and telegraphic switchgear sector, although there were also reductions - but much less pronounced - in the export of carrierfrequency systems.

Nevertheless, in 1993 these two subsectors still accounted for 69% of the total, although in 1989, with 95%, they had been disproportionately more important. This development was accompanied by a drastic shrinking of the EU market for telephone switchgear, which was matched by an increase in the importance of other non-specified countries (including the former state-trading countries).

Computers, office equipment

Computers and office equipment are by far the most important EFTA imports of HTP, reaching a total value of ECU 6.8 billion in 1993 - a value which remained constant over the entire reference period in nominal terms. As in the case of the EU, parts for computers and computer components were the most important subgroup, with a share of 30%. CPUs accounted for 24%, i/o units for 21% and storage for 9%. Complete PCs were of lesser importance with a mere 6%.

The main supplier was the EU, with almost 50% in all the reference years. The United States followed with around 25%. By way of exception, the United States was the leader in the case of wordprocessors, while Japan and the EU shared the lead in photocopying machines.

Like imports, exports of computers and office equipment remained fairly stable over the entire reference period, reaching ECU 2.2 billion in 1993. However, as in the previous years, this was only around one third of the import value for this sector. Parts for computers and computer components were also the most important individual export item, with 33% in 1993, followed by central processing

units with 26% and i/o units with 24%. The EU was by far the most important export market, together with the United States in individual areas such as storage units.

Electronics

Imports of electronic components into EFTA increased substantially to ECU 2.7 billion in 1993 (24% up on 1992) after remaining around ECU 2.1 billion and ECU 2.2 billion in the previous years. The United States, Japan and the NICs6 group accounted for this increase, which was at the expense of the share of imports from the EU, although these also increased but to a below-average extent. Nevertheless, with 40%, the EU remained the most important supplier.

The increase was largely due to growth in imports of the most important individual product group, integrated circuits and microcomponents, which increased by 44% in 1993 over 1992, reaching over 50% of the total import value of electronic components. Of the other individual items, only switchboards and printed circuits were of any significance, accounting for 10% and 7% respectively in 1993. However, since there was no substantial increase in imports of these products over the reference period, these shares had been greater in previous years.

As mentioned before, the main supplier was the EU. This also applied in the case of integrated circuits, up to 1992, after which the United States took the lead. The NICs6 group were also important suppliers, in third place after the EU. Printed circuits and switchboards came primarily from EU countries.

EFTA exports of electronic components totalled some ECU 1.6 billion in 1993. Here too, therefore, there was a major import surplus. The fluctuations in previous years had largely been caused by the developments in integrated circuits and microelectronic components, which were the most important items in 1993 with a share of 38%. Switchboards (up to 1 000 V) with 18% automatic control systems with 15% and printed circuits with 12% were the next three most important items.

The EU was EFTA's main customer for general electronics throughout the reference period. This was also true in all the individual product areas, including those for which there was a market, albeit insignificant in terms of value, in, for example, the USA (eg. X-ray tubes, light-sensitive semiconductors).

Consumer electronics

With imports to a value of ECU 1.2 billion in 1993, this is one of the minor product groups. Nevertheless, it increased by more than 50% over the reference period, mainly in the period up to 1992. The sector is dominated by prerecorded information media (CDs, CD-ROMs), which accounted for over three quarters of the total imports of consumer electronics in 1993. The increase over 1989 in this area was over 100%, 70% of imports in 1993 coming from the EU. Throughout the reference period, Japan was far ahead of the competition as a supplier of TV cameras, including camcorders, and CD players. The United States was significant as a supplier only in the case of CDs and CDRoms.

Throughout the entire reference period, EFTA exports of consumer electronics were well below imports, but the growth rate was greater, with the result that they nevertheless reached 53% of the import value in 1993, with ECU 622 million, compared with 34% in 1989. Very little changed in the structure of exports, with CDs and CD-ROMs determining the overall development, increasing substantially and steadily to account ultimately for 90% of the total.

Here too, the main customer was the EU, but intra-EFTA trade was also very important.

Scientific instruments

In 1993, EFTA imports of scientific instruments came to a total value of ECU 832 million, a little less than in the previous year. Compared with 1989, the overall increase was a good 15%. Because the relatively low total amount was broken down into a large number (22) of individual items, the import values were generally low. Apparatus for electrical diagnosis (including cardiography) with 20%, prosthetics with 16% and X-ray equipment with 15% were the most important individual items in 1993. Other radiological equipment and installations as a whole (alpha, beta and gamma radiation etc.) accounted for 10% of the total, and hearing aids and pacemakers 9%.

The leading suppliers in 1993 were the EU followed by the United States, together accounting for a total of 80%. However, there were a number of noteworthy exceptions: pacemakers and cathode ray-oscilloscopes came from the United States while intra-EFTA trade was important in addition to imports from the EU in the field of radiological equipment, and in other areas the USA and the EU were equally important suppliers (eg. electromedical equipment).

EFTA exports of scientific equipment totalled ECU 1 101 million in 1993 and were thus clearly in excess of imports. There was an increase over the reference period as a whole.

The main export items were prosthetics (20%), electromedical diagnostic equipment (19%), hearing aids and pacemakers (16%), X-ray equipment (9%) and other radiological equipment (13%).

The main markets for scientific equipment from EFTA were in the European Union, while the United States was also significant, particularly in the case of alpha, beta or gamma ray equipment for medical applications.

Machinery

EFTA's imports of machinery reached a maximum (ECU 516 million) in 1990, after which it fell to ECU 383 million by 1993 as a result of the bad economic situation and reluctance to invest. 53% of the total was accounted for by imports of gas turbines. Transfer equipment with 18% and laser-controlled machine tools with 11% were other important items. However, the importance of transfer equipment had fallen substantially compared with previous years in which it had accounted for well over 30%. The proportion accounted for by gas turbines had been substantially lower than in 1993.

Since the EU supplied 70% of the total gasturbine components in 1993, it was also the most important supplier in the entire gasturbine sector, even though the United States was the leader in imports of complete gas turbines. The fluctuations over the reference period suggest that major contracts are very significant in the gasturbine sector. Transfer equipment was largely imported from EU countries.

High-tech mechanical engineering is also an area in which the EFTA regularly has export surpluses. In each of the five years under consideration exports exceeded imports by over 100%, settling at a little over ECU 1 billion.

With 36%, gas turbines and gasturbine components were also the most important export items in 1993, but laser-controlled machine tools with 23%, automatic welding equipment (21%) and NC grinding machinery (30%) were also important, which meant that the export structure exhibited somewhat more variety than the import structure. Transfer equipment accounted for only 6% of exports of machinery in 1993, compared with 18% of imports. Imports and exports in 1993 were in balance, with ECU 69 million each, imports having been much higher than exports in the previous years.

Nuclear energy

Imports of products in the nuclear energy sector fell during the reference period to ECU 330 million in 1993. Three product groups were involved: non-irradiated fuel elements (65%), enriched fuel elements (31%) and nuclear-reactor components (almost 4%). Fuel elements were mainly imported from members of the EU (76%) and EFTA, while fuels were imported from the EU and other countries.

EFTA imports of nuclear-energy products totalled only ECU 107 million in 1993 - less than one third of imports. The main export item was non-irradiated fuel elements, with 86%, which were exported almost exclusively to EU and EFTA countries.

Chemicals

This product group comprises only a very small subsection of the entire range of chemical products on offer. EFTA imports increased to ECU 300 million between 1989 and 1991 but then fell slightly to ECU 294 million in 1993. Here too, only three product groups were of any importance - hormones (43%), PETP (36%) and radioactive elements and isotopes (14%). PETP has steadily increased in importance in recent years whereas imports of hormones reached a peak in 1991 which could not be maintained even in absolute terms. The main supplier in all three areas was the EU.

EFTA may well be a net importer of chemicals, but this is no longer the case in the most important subsector, i.e. hormones, where exports were higher than imports in 1993. HTP imports in the chemicals sector totalled some ECU 195 million in 1993, of which 77% were hormones and 14% radioactive elements and isotopes.

The main markets for exports were in the EU.

Weapons

EFTA imported weapons to a value of ECU 334 million in 1993, which was considerably less than in 1992. The main import item was ammunition (70%) and the main suppliers were EU and EFTA Member States in so far as the origins of the weapons was indicated at all.

In the weapons sector too, EFTA was a net importer during the reference period. Exports of weapons fell over the reference period. Almost four fifths of the total accounted for by bombs, grenades and similar heavy arms. A large proportion of exports went to non-specified other countries (small quantities to Canada) and in some cases the destination was not recorded at all.

United States

Generally speaking, Canada was an important trade partner, both as supplier and recipient, in addition to the partners dealt with in this study.

Aircraft and spacecraft

United States imports of products in the aircraft and spacecraft sector increased steadily from 1989 to 1993, finally reaching ECU 7.9 billion. 54% of this total was accounted for by engines and 38% by aircraft by various weight categories. Both engines and aircraft and helicopters came from the European Union and Canada.

The low level of United States imports in many subsectors of this product group reflect a high level of coverage from indigenous production (eg. helicopters or radar/navigation instruments).

With ECU 25.2 billion in 1993, US exports of aircraft and spacecraft formed one of the most important HTP export groups, which was slightly exceeded by the computer sector only in 1993.

In 1992, exports of aircraft and spacecraft products had a total ECU 26.9 billion, giving the United States a considerable export surplus in this field. Imports never reached even one third of the export figure over the reference period.

The most important subsector was aircraft with an unladen weight of over 15 t, accounting for almost two thirds of total exports in this sector. Together with medium and small aircraft, these accounted for over 70% of the total. Around 8% of engines exported were jet engines, less than 1% turboprop engines and almost 12% components.

The most important markets were in the EU, the NICs6 and NICs9 groups and other industrialized countries such as Canada. The NICs6 group was particularly important as a market for helicopters of at least 2 t unladen weight.

Telecommunications

The telecommunications product group is relatively unimportant in US HTP imports, accounting for ECU 1.5 billion in 1993. After reaching a level of ECU 1.4 billion in 1989, imports fell in 1990, but rose again in subsequent years. The most important individual items in 1993 were telegraphic equipment (65%) and carrier-frequency systems (22%). The main suppliers were Japan, the NICs6 group and Canada. The majority of test equipment and optical fibre (for data transmission) came from the EU. However, these two sectors together accounted for only just under 5% of the total. Up to 1992, exports and imports were more or less in balance in the telecommunications sector. However, in 1993, exports, (with ECU 1.8 billion) were substantially higher than imports. The most important products were telephone and telegraphic switchgear and carrier frequency systems. Important markets included the EU and Canada.

Computers and office equipment

Computers and office equipment account for 50% of US imports of HTPs and are thus by far the largest main group of products. Their 1993 import value was ECU 33.9 billion, following a constant increase since 1990. Computer spares and components took the biggest share at 29%, followed by input and output units (24%) and storage units (barely 24%). Host computers (8%), complete PCs (6%) and photocopiers (4%) each took only a small share of the market.

NICs6 and Japan were the biggest suppliers not only in general, but also of individual products and product groups.

In 1993, computers and office equipment became the largest group of US HTP exports. Following a fall-off from 1989 to 1991, exports rose again sharply in both 1992 and 1993, ending up at ECU 25.3 billion. However, they failed to keep pace with imports, which had been increasing dramatically since 1990, and the USA has been a net importer since 1991.

The biggest sub-group here, at 38%, was computer spares and components, which until 1992 showed a clear export surplus. The USA were net exporters of central processing units over the entire reference period (1993 share: 20%), but were net importers of input and output units and storage units (14% each).

The EU Member States were the main outlets, but other countries such as Canada took a noticeably large share of some product categories.

Electronics

This main group of products accounted for 28% of the USA's high-tech imports in 1993, at a value of ECU 19.8 billion - 37.6% up on the previous year's figure. Of the 21 items, only integrated circuits and microcircuits reached a significant value, accounting for over 75% of imports of electronic components - an indication that US production of this range of products is wide-ranging and reliable. Printed circuits came second and third, at 5.6% and 3.3% respectively; all other items accounted for less than 3% each. This import structure remained largely unchanged over the entire reference period; printed circuits took a larger share and integrated circuits were slightly down in 1990 and 1991.

NICs6 were by far the biggest supplier, particularly where integrated circuits and microcircuits were concerned, and were followed by Japan. The EU played a subordinate role as a supplier, behind NICs9 and Canada, except for microwave and other tubes, thyristors, signal generators and above all X-ray tubes.

Electronic components took a 23% share of US exports of HTP in 1993, at a value of ECU 19.2 billion - a very steep increase over the two previous years. Electronic integrated circuits dominated exports as well as imports, accounting for 77% of the main group. Printed circuits and automated control systems came next, at 5% and 4% respectively. The export and import structure of the USA in this sector is a good example of intra-industrial trade. The export value of integrated circuits and microcomponents was 1% below their import value in 1993; in 1992 it had been 5% higher. Relationships were similar in the whole main product group.

The NICs6 area was by far the largest customer, followed by Canada and the EU. The EU was the leading purchaser of certain microwave tubes, piezoelectric crystals, X-ray tubes and signal generators in 1993, but these together accounted for only 2% of the main group.

Consumer electronics

Consumer electronics are a low-value sector of HTP imports by the USA, having reached a total import value of ECU 3.1 billion in 1993. The biggest single item was TV and video cameras, at 54% of the total. There were strong fluctuations during the reference period, with the overall result remaining the same, whilst various rates of growth were recorded in the other items. Japan was the biggest supplier: only CDs and CD-ROMs came primarily from the EU and Canada.

US exports of consumer electronics in the high-tech sector amounted to ECU 2.5 billion in 1993 - well below the import value of these items. Exports have made up a great deal of ground, however, with a 28% share of imports in 1989 rising to 79% in 1993. The main exports were CDs and CD-ROMs,

which accounted for 90% of the main group. Exports of these items showed a steep increase over the reference period, with the EU and Canada as the main markets.

Scientific instruments

This main product group had an import value of ECU 2.2 billion in 1993 and showed a rising trend with fluctuations over the reference period. The most significant items were electromedical diagnosis equipment (29%), X-ray equipment (31%) and other radiological equipment (15%). In 1993 the EU supplied more than half of all HTP in this group, with above-average figures in particle accelerators, laser equipment, prostheses, pacemakers and X-ray and other radiological equipment.

The value of exports from the USA of scientific high-tech instruments was ECU 4 billion in 1993 - far more than in previous years, but still amounting to less than 5% of the main group of HTP exports. This sector is one of export surpluses, which increased steadily over the reference period.

The main items in this group were electromedical diagnosis equipment and electrocardiographs, which together accounted for 36% of the total, followed by implants at 10%, X-ray equipment at 11% and alpha, beta and gamma-radiation equipment and spectrometers at 7% each.

The biggest market for both scientific instruments as a whole and individual items from the USA is the EU. One exception was artificial limbs, of which almost as many were exported to Japan in 1993 as to the EU.

Mechanical engineering

Mechanical engineering is another sector in which the demand is met largely by domestic suppliers, since their US import value in 1993 was only ECU 1.3 billion. 42% of this total consisted of gas turbines and components and 24% of transfer equipment. Imports of gas-turbine components and small gas turbines increased sharply in the reference period; other items showed only a very slight upward trend, or even a distinct downturn. Total imports of high-tech machinery regained their 1989 value only in 1993, following a marked slump.

Imports of machinery came primarily from Japan over the entire reference period, with the EU in second place.

US exports of high-tech machinery amounted to ECU 2.6 billion in 1993 - twice as much as imports in the same year, and a steep upturn following the slump in 1991. Almost four-fifths of exports in 1993 were of gas turbines and components, which accounted for the export surpluses. Apart from these, only laser-controlled machine tools showed a significant value, at 13%.

The EU and other countries (Canada) were the main purchasers, but NICs countries were also major customers for certain items, particularly gas turbines.

Nuclear energy

Total imports of HTP in the nuclear-energy group amounted to ECU 0.7 billion in 1993 - a slight fall-off compared with previous years. They consisted almost exclusively of natural uranium (from Canada, Australia and state-trading countries) and enriched uranium and plutonium, chiefly from EU Member States. While imports of natural uranium fell, those of enriched uranium increased significantly.

Products from the nuclear energy sector played a secondary role in US exports, but exports exceeded imports over the entire reference period. Of total exports (ECU 1.0 billion) in 1993, enriched uranium and plutonium accounted for 78%, followed by reactor components (8%), non-irradiated fuel elements (6%) and natural uranium (4%).

Almost two-thirds of exports in 1993 went to Japan, with the remainder divided almost equally between the EU and NICs⁶.

Chemicals

The import value of chemical HTP was ECU 345 billion in 1993. There was an appreciable increase over the reference period. The main single items were radioactive elements and isotopes (except uranium, thorium and plutonium), which accounted for 28%, hormones at 25%, rareearth compounds at 17%, highest-grade silicon at 12% and PETP at 11%. The EU Member States were the main suppliers, while Canada was by far the strongest supplier of radioactive elements and isotopes.

Chemical HTP exports by the USA amounted to ECU 840 million in 1993, following a steep increase since 1991. Here, too, the USA are net exporters. Hormones took the largest share of chemical exports, at 44%. PETP (25%), radioactive elements and isotopes (14%) and highest-grade silicon (12%) were also significant. The main purchasers, particularly of hormones and radioactive elements, were the EU Member States. Highest-grade silicon was exported chiefly to Japan, at least from 1991, while the PETP markets were primarily in other countries (Canada).

Weapons

At a total value of ECU 186 million in 1993, this main product group made a negligible contribution to US HTP imports. More than half of these imports consisted of heavy ammunition (bombs, grenades etc.), imported largely from NICs countries. The weapons sector has shown sharp fluctuations over the years, with the EU as the main supplier.

US imports of weapons are totally insignificant compared with their exports, the 1993 ratio being 12.5:1. The export value was ECU 2.3 billion in 1993, and even this probably reflects only part of the total US weapons trade. 61% consisted of heavy ammunition and 34% of tanks and armoured cars. The EU Member States and Japan together purchased half of the heavy ammunition, while a quarter went to other countries such as Canada. Other countries were the main customers for armoured vehicles.

Japan

Aircraft and spacecraft

Japanese imports of products in the aircraft and spacecraft sector totalled some ECU 3.1 billion in 1993 - a slight increase over the three previous years, reflecting the increase in the largest item, aircraft with an unladen weight of over 15 t, which accounted for two-thirds of imports in 1993. With medium-sized and small aircraft included, aircraft accounted for 69% of the main product group. A further significant branch is jet and turboprop engines, including their components, which amounted to just 20% in 1993. As a result of shrinking imports of engines in previous years, this sector has

declined sharply in importance (its share in 1989 was 38%). Both import groups came overwhelmingly from the USA.

Japanese exports of HTP in the aircraft and spacecraft sector are almost negligible. This also applies to exports of certain other main product groups, which are discussed below. The 1993 export value was ECU 515 million, 62% of which consisted of radar and other navigation equipment and 26% of engine components. Exports of the main group increased significantly in 1992 and 1993, the main clients being the EU and the USA, but also NICs6 and NICs9 countries where radar equipment was concerned.

Telecommunications

At ECU 450 million, telecommunications played only a small part in Japan's HTP imports in 1993, but this value was still twice that of the previous year. The main single item, at 58%, was telephone and telegraphic switchgear, most of which came from the USA, followed by EFTA countries. The USA was also the main supplier for the whole group.

The telecommunications main product group achieved an export value of ECU 2.8 billion in 1993 and a remarkable export surplus. The value had been rising since 1990, but had not yet equalled the 1989 export value of ECU 3.2 billion. The main export item over the entire reference period was telegraphic equipment, which in 1993 accounted for 61% of exports, while telephone and telegraphic switchgear accounted for a further 22%.

The USA was the biggest customer in 1993, at just under a third of the total; substantial deliveries were also made to the NICs area. The EU was a far less significant customer than in previous years.

Computers and office equipment

The main product group of computers and office equipment took the biggest share - roughly a third - of Japanese HTP imports. Average import values increased moderately from 1989 to 1992, but in 1993 jumped by +26% to ECU 5.7 billion.

The main sub-groups were computer components at 39%, central processing units at 29%, storage units at 14% and input and output units and complete PCs at 6% each. The USA and NICs6 were the main suppliers.

Computers and office equipment were also by far the largest group of Japanese HTP exports, attaining a value of ECU 24.9 billion in 1993 - 21% more than in 1992, and 44% of total HTP exports. A further indication of the importance of EDP exports is that, in 1993, Japan exported well over four times as much as it imported in this sector.

Computer components were the biggest export item in 1993, at 32%, followed by input and output units (25%), storage units (17%), complete PCs (10%) and photocopiers (10%). The main outlets over the entire reference period, together accounting for some 80%, were the USA at roughly 50% and the EU with an average of just under 30%. The NICs6 countries, strong rivals to Japan in this high-tech field, also increased their purchases.

Electronics

Imports of electronic components accounted for 27% of Japan's HTP imports in 1993, at a value of ECU 4.7 billion - significantly higher than in previous years.

The main single items, as in the other regions and countries covered by this report, were integrated circuits, which accounted for 77% of all electronics imports in 1993. Other items such as printed circuits, diodes, transistors, light-sensitive semiconductors, piezoelectric crystals and automatic control systems accounted for only 2-3% each.

Japan's purchases came mainly from the USA and the NICs6 countries. The EU played an appreciable role only with individual items such as printed circuits and thyristors.

General electronics were the second largest group of Japanese HTP exports, with a share of just under 34%. Their 1993 export value was ECU 19.2 billion - a whole 42% more than in 1992. Here, too, Japan was a net exporter, with a ratio of 4:1.

Electronic integrated circuits and microcomponents also dominated Japan's electronics exports in 1993, with 1 64% share. Of the remaining items, capacitors and switchgear each took a share of over 6%, and a few other product groups 3-4%.

Roughly half of electronics exports over the past few years went to the NICs6 countries, and over a quarter to the USA. The EU has lost ground, purchasing only a tenth of Japan's electronics exports in 1993.

Consumer electronics

Japan's low level of imports of consumer electronics products is explained by the fact that Japan is the world's leading exporter in this sector. Significantly, its imports are usually of items in which Japanese exports are weak, such as data-storage media (CDs and CD-ROMs). 85% of total imports of consumer electronics in 1993 consisted of this sub-group, at a value of ECU 423 million. Almost two-thirds of CD and CD-ROM imports came from the USA and roughly a quarter from the EU.

Japanese exports of consumer electronics amounted to ECU 5.6 billion in 1993, compared with imports amounting to ECU 0.4 billion. There was a steep increase in 1991, above all in TV and video cameras and to the EU; the boom in consumer products following German unification may be the explanation for this. The 1991 peak was not sustained in 1992 and 1993.

TV and video cameras accounted for 65% of the export value in 1993, CD players for 22% and video playback equipment (disc or CD technology) [? missing from original-translator]. CDs and CD-ROMs played a negligible role, as mentioned above.

The flow of Japanese camera exports to the EU was particularly strong in 1991 and 1992. In the other reference years the US market played the dominant role. US outlets took first place over the entire reference period where total exports of this main product group were concerned.

Scientific instruments

The main product group of scientific instruments was likewise one of the smaller HTP groups in 1993, with an import value of ECU 921 million, but a strong upturn was nevertheless recorded over the reference period. The main single items were electromedical diagnostic equipment, including cardiographs (22%), followed by artificial limbs (19%), hearing aids and pacemakers (12%) and X-ray equipment (12%). The USA were by far the biggest supplier, followed by the EU.

Japanese exports of scientific instruments are of minor importance, having amounted to ECU 2.3 billion in 1993. They nevertheless expanded rapidly over the reference period, together with the export surplus (to ECU 1.3 billion), despite the strong growth in imports mentioned above.

Of the many sub-groups, only electromedical diagnostic equipment including cardiographs (38%), LCDs (liquid crystal displays) (21%) and X-ray equipment (also 21%). The main markets for the whole period were the EU and the USA, although the NICs6 countries have penetrated the market increasingly in the past few years. The NICs9 countries were significant customers for X-ray equipment.

Mechanical engineering

Of Japanese mechanical engineering imports, which reached a value of ECU 487 million in the HTP sector in 1993, gas turbines and components were the only large sub-group, taking a 75% share. Laser-controlled machine tools accounted for 16%. Mechanical engineering imports grew over the reference period, the main suppliers being the USA and the EU.

Japanese HTP exports in the mechanical engineering sector took only a small share of total HTP exports at ECU 1.6 billion, but they were still three times the value of imports. The trend over the period showed fluctuations; the 1993 export value was less than that of 1989.

Transfer equipment accounted for one-third of exports in 1993 - considerably less than in previous years. Laser-controlled machine tools (20%), gas turbines and components (19%), automatic welding equipment (16%) and NC grinding machinery (10%) were further significant export items.

The main outlets were the USA and the NICs6 countries. The EU has lost ground while the NICs9 countries have caught up.

Nuclear energy

Japan's nuclear energy imports consisted almost exclusively of enriched uranium and plutonium, which accounted for 91% of the total import value of ECU 1.1 billion. Natural uranium accounted for just under 6%. The import trend from 1989 to 1993 was only slightly upwards. Imports came chiefly from the USA and EU Member States.

Japanese HTP exports in the nuclear energy sector in 1993 consisted of components for nuclear reactors, at a value of ECU 26 million. The outlets were the EU, the USA and other countries.

Chemicals

The total import value of high-tech products in the chemical sector in 1993 was ECU 409 million. The three main sub-groups were highest-grade silicon at 33%, hormones at 22% and radioactive elements and isotopes at 21%. There were strong fluctuations in total imports over the period, with no clear upward or downward trend. The USA and the EU were the main suppliers for the entire sector, but the the NICs6 and NICs9 countries were strong in certain products.

Japan exported ECU 194 million-worth of high-tech chemical products in 1993 - less than half of its imports. There has been a slight growth since 1989. The main export products were highest-grade

silicon (48%), PETP (25%) and rare-earth compounds (11%). A large proportion of these went to the NICs6 countries and the EU.

Weapons

Japan's imports of weapons in 1993, valued at ECU 76 million, consisted of heavy ammunition (85%) and unspecified military weapons (15%). Two-thirds came from the USA and a third from the EU. Japan's exports of weapons in 1993 were valued at ECU 236 million (1992: ECU 4 million) and consisted largely of heavy ammunition, supplied to the EU, NICs6 and other unspecified countries.

2.6 Trade structure by branch

The results of the product-based analysis can be aggregated to give results for the branches concerned and examined from this perspective. The breakdown from branch to product was, however, carried out for good reasons and is still considered advisable for high-tech analysis.

An attempt to classify the main product groups used in this study under the branches of industry in the NACE classification quickly shows that the differences are restricted to the electrical and electronics industry. Nuclear energy products are attributed to the electrical industry (NACE 31) and and the telecommunications, general electronics and consumer electronics branches are grouped under NACE division 32: electronics industry. This means that only the electronics branch requires special analysis below. The statistical breakdown of main product groups and branches in this study is identical in all other areas. The armaments industry was separated out even though NACE classes it as mechanical engineering, since an aggregate would have been of no use either for the purposes of this study - trade developments in high-tech products - or for methodological reasons (weapon imports and exports are far from fully documented, which means that few meaningful economic conclusions can be drawn).

There are some classification problems. Medical engineering, for example, is classified under scientific instruments, but is attributed to electrical engineering rather than to precision and optical instruments, watches and clocks. Because of the calculation difficulties involved, however, we refrained from regrouping all 110 items by branch, since it was by no means clear that this would improve the significance of the results.

The correspondence is shown below:

<u>Productgroup</u>	NACE	Branch of industry
Aircraft and spacecraft products	35.3	Aerospace industry
Computer and office equipment	30	Office equipment industry
Telecommunications products General electronics (components) Consumer electronics	32	Electronics industry
Nuclear energy	31	Electrical engineering
Scientific instruments	33	Precision and optical instruments, watches and clocks
Mechanical engineering products	29	Mechanical engineering
Chemicals	24	Chemical industry
Weapons	29.6	Armaments industry

The combination of three product groups under the electronics heading exacerbates a problem which is common to all data-processing operations. Merely using a breakdown into ten main product groups meant that three groups dominated all commentaries. Reducing the list to eight groups further exacerbates the imbalance.

The absolute values and weights of the product groups have been set out in tabular form by branch for the four reference regions and countries in accordance with the above scheme. The effects of combining the trends in the three groups concerned under the electronics heading, i.e. whether the differences are magnified or attenuated as a result, are also discussed.

This breakdown means, as explained above, that three branches heavily weighted towards high tech are set against five which, even when put together, are smaller than any of the large branches; only the EFTA figures show an exception to this rule.

European Union

EU imports in the three product groups combined to form the electronics industry grew strongly in the reference period, but with fluctuations presumably caused by short-term changes in economic conditions. Imports in the consumer electronics sector only were almost 10% down on the previous year's figures. Exports showed a similar trend. The upward trend in electronic components, never very pronounced, was halted in 1992 but continued in 1993 with a 27% increase over the previous year.

Table 8

Breakdown by branch of external trade in high-tech products: EU

Branch	Imports				Exports			
	1989		1993		1989		1993	
	ECU billions	% share	ECU billions	% share	ECU billions	% share	ECU billions	% share

European Free Trade Association

Branches which are of minor significance overall have a large weight in the EFTA data, particularly where exports are concerned (Table 9). This is due partly to the relatively small share of the aerospace industry in imports and exports and partly to the importance of mechanical engineering and precision and optical instruments, watches and clocks.

The import trends in the product sub-groups of the electronics industry were uneven: no change in telecommunications, no change and then a rise in electronic components, and growth in consumer electronics. There was a marked balancing effect in exports. Telecommunications exports fell in 1991 to less than half of their level the year before, while consumer electronics exports rose dramatically. Electronic components fluctuated from year to year, with a tendency to remain constant.

Another interesting feature of the EFTA figures compared with those of the EU, the USA and Japan is the total lack of momentum over the reference period: total imports rose only slightly and exports actually fell.

Table 9

USA

Of US HTP imports, electronic products were in second place, with a one-third share, after office equipment and computers. The three large branches - the latter two and the aerospace industry - each took a 30% share of exports (Table 10). The remaining branches taken together took a 13% share of exports but only a 7% of imports.

Table 10

Breakdown by branch of foreign trade in high-tech products: USA

Source: Eurostat, Tables A 1.2 M/X and A 1.5 M/X in annex; cf. also Tables 2 and 5

The trends in imports of telecommunications products and electronic components were parallel: fall-off in 1990 compared with 1989, followed by an upswing. Consumer electronics showed a late increase after a series of fluctuations. Amongst exports, the electronics branches including telecommunications showed a clear upturn after 1991.

Japan

The "smaller" branches took a considerably smaller share of Japan's exports than of its imports (Table 11). The aerospace industry also counted as an insignificant branch where exports were concerned.

Table 11

Breakdown by branch of foreign trade in high-tech products: Japan

Branch	Imports				Exports			
	1989		1993		1989		1993	
	ECU billions	% share	ECU billions	% share	ECU billions	% share	ECU billions	% share

Source: Eurostat, Tables A 1.2 M/X and A 1.5 M/X in annex; cf. also Tables 2 and 5

The trends in imports in the electronics branch were generally upwards, but were interrupted by years in which there was no change. Consumer electronics exports reached a peak in 1991 but then fell noticeably, while exports of electronic components grew steadily from 1990 and the telecommunications sector remained largely unchanged.

2.7 Trade in products of various levels of technology¹

Since high tech, unlike medium or low tech, also comprises a range of products of disparate levels of technology, we made a further breakdown. The products to be analysed in this study were allocated to three levels labelled "highest", "medium" and "low" high tech (see product list in the annex). The approach taken is similar to that of the previous sections, i.e. exports followed by imports for the EU, EFTA, the USA and Japan are discussed in that order (Fig. 16) with their main partner regions or countries and by main product group. Only a few particularly pertinent observations are made concerning the individual data in the table annex. The highest technology level is missing from some main product groups, such as consumer electronics, mechanical engineering and chemicals, while the low high-tech level is missing from others (telecommunications, weapons). Only the shares of the technology levels in each main product group are discussed below. The turnover weight on which each is based is dealt with only insofar as the three (generally) biggest main product groups are mentioned separately. Although the structures - highest, medium, low level - of the various reference units clearly differed, they remained largely unchanged over the period concerned (Figs. 17 and 18), with only EFTA exports as an exception.

2.7.1 Imports

European Union

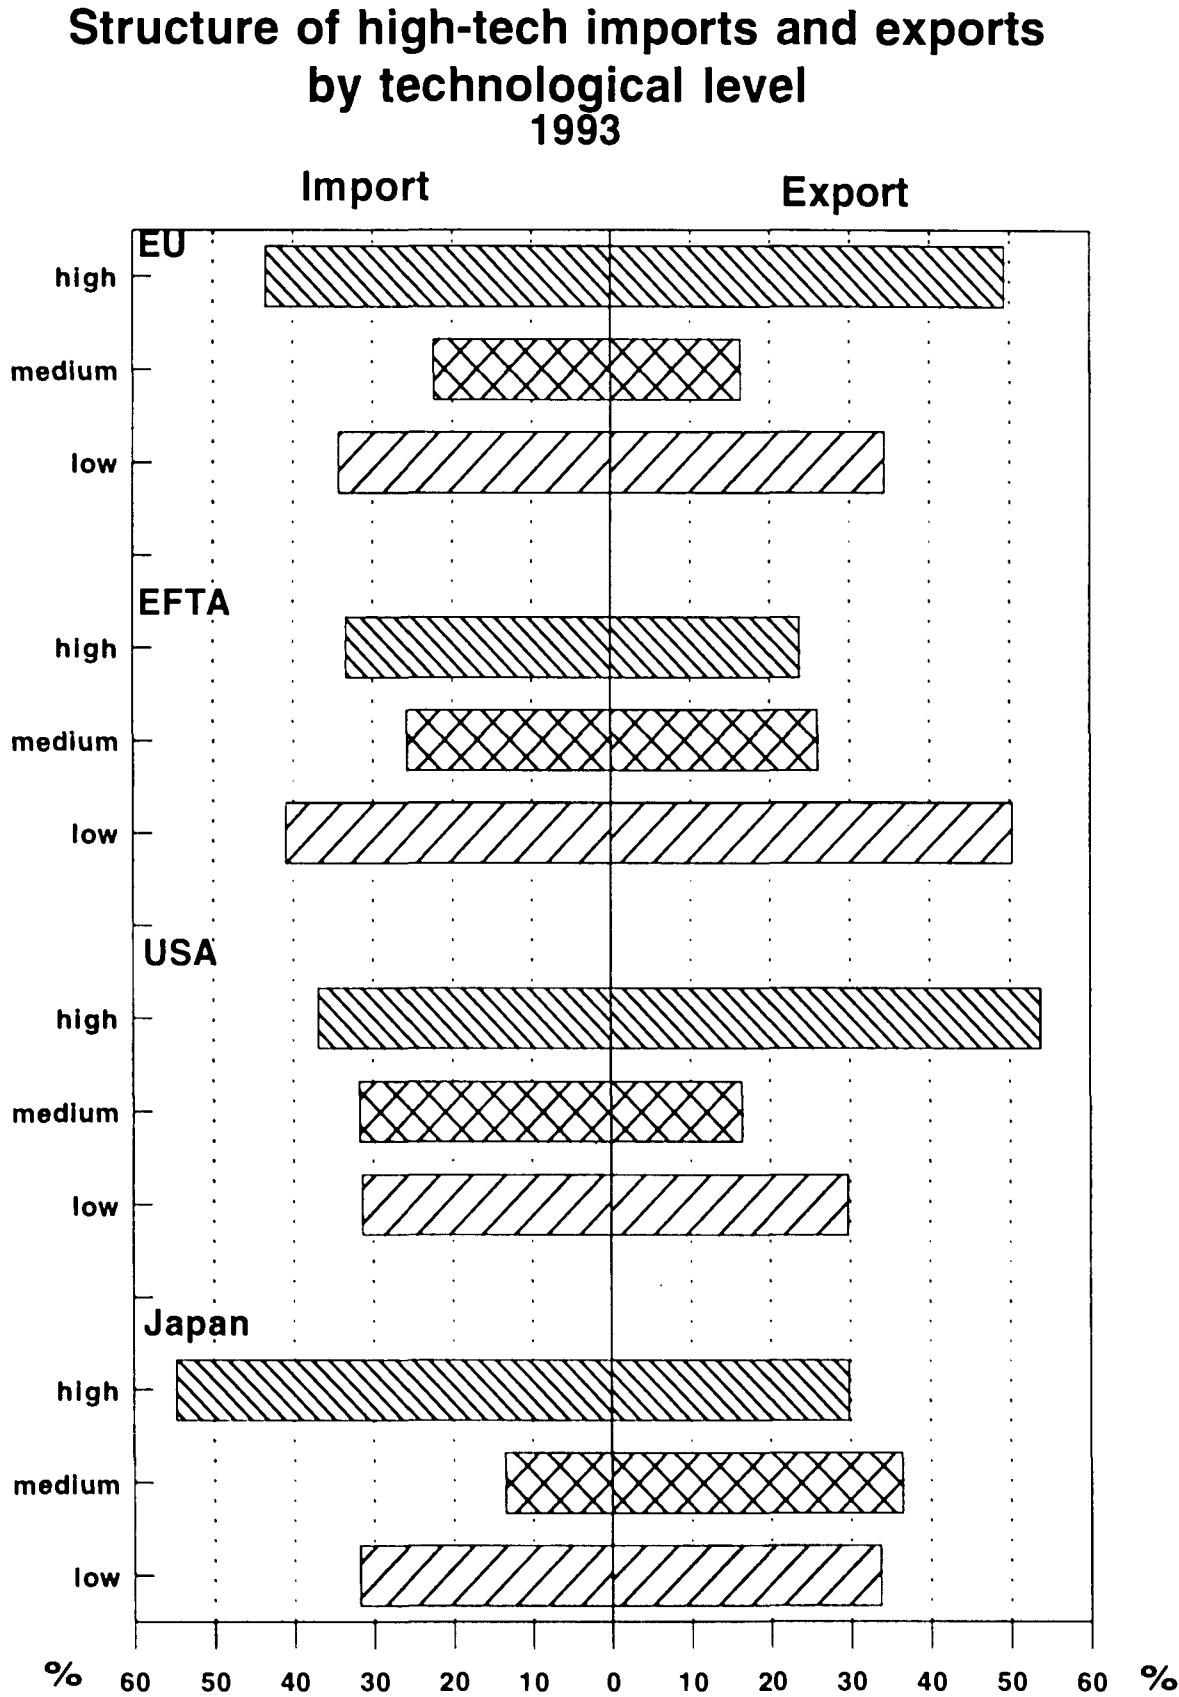

Total EU imports of HTP consist largely of products of the highest technology level. In 1993, 47% of intra-EU imports were highest high tech, 19% medium and 34% lower high tech. The order was the same in extra-EU imports, but the highest level took a slightly smaller share, to the advantage of the medium level. Imports from Japan were an exception to the general rule, roughly half being medium-level and only about a fifth highest-level. The medium category was noticeably under-represented in supplies from the USA, however.

The main product groups aircraft and spacecraft products (primarily EU intra imports and imports from EFTA, the USA and the NICs9 countries) and general electronics (from the USA, Japan and the NICs6 and NICs9 countries) took a particularly large share of the highest high technology in EU imports. The medium level is very small in both groups. Imports from Japan and the NICs6 countries take a very significant share, of aircraft and spacecraft products of a low high-tech level, and those from EFTA predominate in the electronics sector.

Consumer electronics showed a deeply divided market: 96% or more of Japanese supplies in the reference period were medium high-tech products, while over 95% of US supplies were low high-tech. The highest high-tech level is missing from consumer electronics, as mentioned above.

European Free Trade Association

The following regional structure was observed in total HTP imports by EFTA over the reference period: imports from the EU, the EFTA area (intra-EFTA trade) and the NICs9 countries were predominantly low high-tech, those from the USA and the NICs6 countries were chiefly highest high-tech and those from Japan tended to be medium high-tech.

The picture was predictably more varied in the individual main product groups. In aerospace, computers and electronic components (the three biggest main groups), aircraft and spacecraft products were extraordinarily dominant in the highest high-tech class from all supplier areas except the NICs9 countries. In contrast, the shares of the various technology levels in computer and office equipment imports from the EU, EFTA and the NICs6 countries were fairly well balanced, while the low high-tech level dominated supplies from the USA and the NICs9 countries and the medium high-tech level supplies from Japan. The trend in electronic components was similar to that of total HTP imports by EFTA: the EU and EFTA were very strong at the low high-tech level, the USA and the NICs6 countries were very strong in the highest high-tech, while Japan and the NICs9 countries took similar shares of both the highest and the low level.

USA

US imports from the EU were chiefly of highest high-tech products; these also accounted for a large share of imports from the NICs area, although the NICs9 countries also supplied large quantities of low high-tech products. Imports from Japan dominated the medium level. The USA imported mainly low HTP from EFTA countries.

If we look again at the three main product groups with the greatest weight, aircraft and spacecraft imports from the EU, the NICs9 countries and Japan were mainly highest high-tech, but the weight of this level in imports from the NICs6 countries dropped sharply over the reference period. In the main product group of computers and office equipment, highest high-tech products were a relatively unimportant category of US imports from all sources. Japan and the the NICs6 countries supplied roughly equal amounts of medium high-tech except in 1993, while the EU dominated the low high-tech category. General electronics at the highest technology level dominated imports from Japan and the NICs area, while imports from the EU tended to favour low high-tech products in the same group.

Japan

Japan's HTP imports from the USA were chiefly in the highest high-tech group. This was also true of imports from the EU, but to a lesser extent: low high-tech was also fairly important here. Imports from EFTA and the NICs6 and NICs9 countries were very heavily biased towards low high-tech.

Almost all aircraft and spacecraft imports were in the highest high-tech class. The categories were more evenly distributed in the computers and office equipment group, with medium high-tech (EFTA) and low high-tech (NICs6, USA, NICs9) in the lead. The highest high-tech category of imports from the EU increased over the reference period. In general electronics, the highest high-tech tended to come from the USA and to a lesser extent from the EU and the NICs6 countries. Both of these areas were fairly well represented in low high-tech, as were EFTA and the NICs9 countries. Only small quantities of medium high-tech were imported from all suppliers.

2.7.2 Exports

European Union

HTP exports by the EU showed clear distinctions between technology levels: the highest high-tech category was well ahead of low high-tech, and the medium level was relatively insignificant. This distribution was most noticeable with exports to the NICs6 countries, the USA, the NICs9 countries and other EU Member States. Exports to Japan and EFTA were fairly evenly distributed between the highest and the low high-tech categories, however.

Exports of aircraft and spacecraft products to all customers were predominantly at the highest technology level (80% to over 90%) except those to the USA, where this level accounted for around 70%. The shares of general electronics were more evenly balanced, particularly in intra-EU exports and exports to the USA. The highest high-tech tended to go to the NICs6 countries and Japan, and low high-tech to EFTA and the NICs9 countries. Exports of computers and office equipment were less structured: medium high-tech was better represented than the other two groups, accounting for a fifth on average. The low high-tech level dominated exports to the USA in particular and those to other EU Member States and the NICs6 and NICs9 countries to a lesser extent. Highest and low high-tech each accounted for two-fifths of computer exports to EFTA.

European Free Trade Association

EFTA exports of HTP favoured the medium high-tech level to a greater extent than those from the EU or the USA (see below), but to a lesser extent than those from Japan; low high-tech dominated, however. This was particularly true of exports to Japan and slightly less true of those to the USA, the EU and the intra-EFTA area. Exports of low and medium high-tech to the NICs9 countries and of low and highest high-tech to the NICs6 countries were fairly evenly balanced.

The predominance of highest high-tech products in aircraft and spacecraft products can also be seen in EFTA exports, particularly in those exported to Japan, the NICs area or other EFTA countries. Low high-tech was well represented in exports to the USA and the EU, however. Electronic components showed the opposite pattern, with low high-tech dominating almost all exports except those to the NICs6 countries, which were a market for the highest high-tech products. The low high-tech level also dominated exports of computers and office equipment, though to a lesser extent. This was particularly noticeable with exports to the USA and the NICs6 countries. Sales of medium high-tech products to Japan, the USA and the UE were buoyant.

USA

Most HTP exports by the USA were at the highest high-tech level. Just under 50% of exports to the EU were in this category, and a further third consisted of low high-tech products. Well over 50% of exports to Japan, the NICs6 countries and EFTA were in the highest high-tech class.

Like EU exports, 80-90% of US aircraft and spacecraft exports were highest high-tech products; only the EU market was slightly below this level. The pattern of electronic components exports was similar, though somewhat less marked, although low high-tech exports to EFTA, the EU and the NICs9 countries also played an appreciable role here. Of US exports of computers and office equipment, 40-50% of sales to all customers were low high-tech; a third of exports to Japan, the NICs6 countries and EFTA were in the highest high-tech category.

Japan

Roughly half of Japan's HTP exports to the EU and over a third of exports elsewhere were of medium high-tech products, though with appreciably higher figures for EFTA and the USA and lower figures for the NICs15 countries. The highest high-tech category found a good market in the NICs6 countries and low high-tech in the NICs9 countries. The USA, the EU and EFTA were fairly insignificant markets for Japanese products in the highest high-tech class.

Japan's aircraft and spacecraft exports are on so small a scale that they do not require comment here. The opposite is true of the other two main product groups, general electronics and computers. 60% or more of exports of electronic components to the EU, the USA and the NICs6 countries and in general were in the highest high-tech class. Low high-tech products dominated exports to EFTA, while exports to the NICs9 countries were divided fairly equally between the two levels. The medium high-tech level was negligible. The opposite applied to computer exports, in which medium high-tech products clearly dominated exports to EFTA and were just ahead in exports to the EU and the USA. Exports to the NICs9 countries and, to a lesser extent, to the NICs6 countries were clearly dominated by low high-tech products.

2.7.3 Trade balance¹

A comparison of imports and exports by technology level shows at which levels the external trade in HTP of a particular reference area is well-balanced or particularly biased towards imports or exports. Only a few essential or particularly striking patterns or trends in total HTP trade are discussed below; more detailed information is given in the tables in the annex.

European Union

The European Union reveals a fairly balanced structure at the highest high-tech level in both intra-EU and extra-EU trade, but wide gaps between intra- and extra-EU trade at the medium and low high-tech levels. Intra-EU trade was fairly well-balanced. With extra-EU trade in medium high-tech products, however, imports were two to two-and-a-half times the value of exports; imports also outstripped exports in extra-EU trade in low high-tech products.

Analysis of individual trade partners showed clear export surpluses at all levels with EFTA and the NICs9 countries and equally clear export deficits with the USA, Japan and the the NICs6 countries. The only differences between main product groups worth mentioning here are the extra-EU export surpluses in the highest high-tech aircraft and spacecraft products, the large import surpluses in extra-EU trade at all levels in computers and the fairly balanced external trade in scientific instruments; only at the low high-tech level were exports clearly ahead of imports.

¹. The remarks in this section are based on data from table group A 3.1 M and X in the annex.

European Free Trade Association

EFTA had import surpluses at all technology levels in HTP trade with the EU, but only since 1991 at the medium high-tech level. Import surpluses were considerably larger in trade with the USA, Japan and the NICs6 countries. The EFTA countries had a very positive trade balance at the two technology levels of machinery considered here (medium and low high-tech), with both the EU and countries outside the EU and EFTA. There were some exceptions, however: Japan supplied far more medium-level machinery than it purchased. Scientific instruments showed only small export surpluses at all levels. Trade in aircraft and spacecraft products showed a deficit only at the highest high-tech level.

USA

US foreign trade in HTP showed high export surpluses with the EU at all technology levels. Trade with non-EU countries showed clear export surpluses only at the highest high-tech level, however; at the medium high-tech level, imports far exceeded exports. There were wide gaps between partner areas: large import surpluses with Japan and the NICs6 countries at the medium and low levels, and export surpluses, some large, at the highest high-tech level and with the remaining countries at all levels. The USA showed large export surpluses with all partners in aircraft and spacecraft products, the largest at the highest high-tech level in trade with non-EU partners. Export surpluses in computers and office equipment were also substantial except in medium and low high-tech trade with Japan and the NICs6 countries, where imports far exceeded exports.

Japan

Japan's HTP trade balance shows nothing but export surpluses at all technology levels and with all trade partners. In some branches, such as total HTP trade with the EU at the medium high-tech level, exports were twenty times the size of imports (Japanese imports ECU 0.24 billion, Japanese exports ECU 5.5 billion as an annual average over the reference period). The pattern varied according to the main product group, particularly where aircraft and spacecraft products were concerned, already mentioned several times in connection with Japanese import surpluses: Japan had substantial export deficits with the USA at all levels, but with the EU only at the highest high-tech level.

2.8 Summary

Our analysis of various aspects of external trade in high-tech products led us to a number of conclusions.

First, a finding which justifies this study: world trade in high-tech products increased over the reference period in proportion to trade in industrial products and total trade. This is true of both imports and exports and of the four reference areas and countries, with the sole exception of EFTA's HTP exports, which lost ground. The increase in the share of high-tech trade was not very marked, however, and there were some substantial fluctuations over the period, e.g. in US exports. Moreover, a distinction must be made between imports and exports from the point of view of trade and industry policy: the share of high-tech imports by the USA and Japan increased sharply, for example. Of the four reference areas, Japan's foreign trade was most clearly high-tech oriented.

This also becomes clear when trends in HTP trade are directly compared. Japan showed the strongest growth in both imports and exports between 1989 and 1993, but was only just ahead of the USA. The EU's and above all EFTA's shares of total imports and exports fell as a result. In 1989, both together accounted for 67% of total imports and 49% of total exports; by 1993 the figures had fallen to 60% of imports and 45% of exports.

This means that the core of world trade in high-tech products is still in Europe, at least where total EU trade is concerned, and that this weight distribution applies more to imports than to exports. Japan, for example, accounted for 22% of exports but only 8% of imports in 1993.

A further finding was that the weights of the high-tech products selected were very unevenly distributed amongst the ten main product groups. The three main product groups, aircraft and spacecraft products, computers and office equipment and electronic components corresponded to seven branches, several of which - telecommunications and chemicals, for example - were under-representative of their product groups. The trend over time in the large product groups is of particular interest in the light of this structure. In general, the shares of the main product groups have changed little over the five-year reference period. Short-term economic trends may have been responsible for some of the changes noted, and in some cases (aircraft and spacecraft products) large single orders. There is, however, no main product group which can be regarded as a clear winner or loser in imports or exports over the period in the four reference areas or countries.

The calculation of indices illustrated the EU's general deficit (import surpluses) in terms of trade balances and export-import quotients, but this did not apply to all product areas and less still to all partners. In contrast, Japan's foreign trade situation is one of general surpluses, but there were still some exceptions.

The specialisation index (RCA index) shows on the imports side that only the USA showed above-average specialisation from 1991. The USA and Japan showed exports which were well above average over the whole reference period; the EU and EFTA achieved this only in a few main product groups. The European area showed a drop in the specialisation index for HTP as a whole.

The intensity of intra-industrial trade is also illustrated by an index. The EU performed particularly well here, followed by the USA and EFTA. Japan, on the other hand, showed very low two-way trade intensity.

Analysis of individual products within the ten main product groups often revealed a similar phenomenon to that appearing between the main groups: certain products tended to dominate the product group.

Our attempts to allocate main product groups to branches on the basis of the NACE classification were restricted to combining three main product groups in the electronics branch and to classifying the rest under the various branch headings.

A breakdown of the whole range of products into three different levels of high technology showed that just under half of EU imports and exports consisted of the highest high-tech products and one-third of low high-tech products, whereas EFTA imports showed the opposite pattern and medium high-tech accounted for over a quarter of its exports. The US balance was similar to that of the EU. Japan's imports tended to be concentrated on highest and low high-tech products and its exports on medium high-tech.

3. Analysis of trade by EU and EFTA reference countries¹

3.1 Introduction

This chapter is intended to give a picture of the positions of the various member states of the EU and EFTA in international trade in high-technology products. The reference countries are thus the twelve EU Member States and the six countries in EFTA, three of which became EU Member States on 1 January 1995 (Belgium and Luxembourg have been combined).

For the sake of clarity, the imports and exports of each country are analysed one after the other in order to identify balances or show whether the countries are net exporters or importers. The absolute figures are enhanced by indices (export-import quotient, specialisation indices for imports and exports, intra-industrial trade index) and by country portraits in graph form, summarising the most important data of each country.

The reference parameter for calculating the special index for each EU or EFTA country was not the world, but the EU or EFTA. Data on total imports and exports were already available for these reference regions, whereas equivalent "world" data would have had to be calculated (cf. Section 2.4.4).

The sum of the import or export values of the ten main product groups often differs from the sum of the intra- and extra-EU imports or exports. If percentages had been calculated for partner countries, therefore (these are not included in the statistical annex), the sum of the percentages would not have been 100. To avoid this difficulty, a new sum of intra- and extra-EU trade was compiled where necessary and used to calculate partners' shares.

3.2 The EU area

Before analysing the individual Member States we should recall what was said about the EU reference region as a whole (Section 2.3), to give the assessments of the individual countries a framework and a number of mean values.

Total EU imports of high-technology products amounted to ECU 118.6 billion in 1993 and total exports to ECU 107.3 billion - an import surplus of ECU 11.3 billion. A breakdown of imports by main product group showed that computers and office equipment, aircraft and spacecraft products and electronic components dominated in 1993 (Table 2). The main supplier countries outside the EU were the USA, Japan and the NICs15 countries (Table 3). Aircraft and spacecraft products headed the exports list, followed by computers and office equipment (Table 5). The EU's main markets were other Member States, the USA, EFTA and the NICs15 countries (Table 6).

3.3 EU Member States with indices

Germany

German HTP imports amounted to a total of ECU 29.4 billion in 1993, ECU 13.5 billion (46%) intra-EU imports and ECU 15.9 billion (54%) imports from non-Member countries. The main suppliers outside the EU were the USA, Japan and the NICs6 countries, with shares of 17%, 14% and 13% respectively of total German imports in 1993 (Fig. 20).

The trend in German HTP imports since 1989 has been influenced by unification. Imports rose more steeply than those of France and most other EU partners - possibly as a result of the more persistent recession in other Member States and an increased need for high-tech products. HTP exports increased more slowly than in other Member States, however¹.

¹ The remarks in this section are based on data from tables A 1.1 - 1.5 and A 4.1 - 4.4 in the annex.

In 1993, 42% of Germany's total imports consisted of computers and office equipment, 21% of aircraft and spacecraft products and 18% of electronic components. There were wide gaps between supplier countries and regions, however. Aircraft and spacecraft products played an above-average but not primordial role in imports from the USA, while two-thirds of supplies from the NICs6 countries were computers and a quarter electronic components. The aircraft and spacecraft and computers and office equipment sectors accounted for roughly equal proportions of intra-EU imports. Imports from Japan were mainly of computers, electronic components and consumer electronics, while EFTA supplies were primarily of electronic components and computers, scientific instruments and mechanical-engineering products.

Germany's HTP exports amounted to ECU 23.4 billion in 1993, ECU 12.8 billion of which (55%) went to other Member States and ECU 10.6 billion (45%) to non-Member countries. Germany was thus a substantial net importer in 1993, as it had been in 1990-1992; in 1989 its import surplus had been much smaller as a result of far fewer imports.

Germany's main HTP export partners in 1993 were EFTA and the USA, at 11% and 9% respectively, and the NICs6 and NICs9 countries at around 6% each. 12% of German exports went to a list of countries such as state-trading countries, Canada, Australia and South Africa or to unspecified destinations, as mentioned in other sections above. The sectors chiefly affected by these reporting gaps are aircraft and spacecraft products, nuclear energy and weapons.

The weights of the three main product groups in German exports were fairly similar in 1989-1992 but drifted apart in 1993: aircraft and spacecraft products 19%, computers 28% and electronic components 23%. Of the other main groups, only scientific instruments at 10% was significant. Here, too, there were wide differences in export structures to particular destinations. Electronics dominated exports to the NICs6 countries and scientific instruments those to Japan.

Exceptions to the general picture also appeared when the trade balances of individual main product groups were examined in the context of Germany's status as a net HTP importer. Computers and office equipment were a huge exception (1993: imports ECU 12.3 billion; exports ECU 6.4 billion) and aircraft and spacecraft products less so (imports ECU 6.2 billion; exports ECU 5.4 billion). The opposite applied to electronic components (imports: ECU 5.2 billion; exports: ECU 5.4 billion), and above all to scientific instruments (imports: ECU 1.2 billion; exports: ECU 2.4 billion), as in previous years.

The export-import quotients for total German trade in HTP were less than 1.0, in accordance with the negative trade balance. They fell during the reference period, meaning that exports lost further ground against imports. This trend was particularly obvious in trade with Japan and somewhat less so with the USA and the NICs6 countries. The extreme figures (less than 0.1 or over 10.0) recorded in various main product groups vis-à-vis certain partner countries are the computational result of a very low turnover in foreign trade; they are not due to a particularly negative or positive trade balance.

The specialisation rate of German foreign trade in high-tech products is neutral on the imports side, since there were no above-average or below-average values in imports as a whole. Several main product groups are, however, very far from average. There is high specialisation, i.e. a need for imports, in telecommunications, electronic components, consumer electronics, scientific instruments and mechanical engineering products. On the exports side we see below-average specialisation in the entire HTP range, although index values far above average were also recorded for exports of

several of the product groups mentioned above: telecommunications, electronic components, scientific instruments and machinery. This means that both imports and exports of these products were highly significant and possibly that Germany has a high intra-industrial trade intensity.

M and X, A. 4.4 in annex.

This is certainly the case with machinery and components, but there are other main product groups with a high intensity (around 0.0) in which there was no simultaneous specialisation in imports and exports. Germany's intra-industrial specialisation is very high in HTP trade as a whole, but this is a balancing effect: apart from its intra-EU trade, which is in equilibrium, its export and import flows with its various major partners are far from well-balanced.

France

France's HTP imports in 1993 were only slightly below Germany's, at ECU 28.1 billion. Like those of Germany, they showed strong growth in the reference period before falling in 1993. 55% came from other Member States, 23% from the USA, 4% from Japan, 5% from the NICs6 countries and 3% from EFTA. 10% came from unspecified countries or were unrecorded (Fig. 21).

The most significant main product groups were aircraft and spacecraft products at 48%, computers and office equipment at 26% and general electronics at 12%. Supplies from the USA accounted for a particularly large proportion of aircraft and spacecraft imports, while computers and office equipment were significant imports from the NICs6 countries and Japan. Aircraft and spacecraft products also formed the majority of intra-EU imports and supplies from EFTA.

France's HTP exports exceeded its imports in 1993 by over 9%, at a value of ECU 30.7 billion. Export surpluses had been achieved before that year. 47% of its 1993 exports remained in the EU; a further 17% went to the USA, 5% each to EFTA, the NICs6 countries and the NICs9 countries, and 2% to Japan. 19% went to other countries such as state-trading countries, Canada and South Africa.

Aircraft and spacecraft products dominated French high-tech exports in all directions, with peak supplies to certain countries or regions. Computer exports to EFTA and electronics exports to the NICs6 countries are worth mentioning. French nuclear energy technology exports to Japan were also significant.

The import-export balance within certain main groups thus shows that the total 1993 export surplus of ECU 2.6 billion was the result of a surplus of ECU 5.7 billion in aircraft and spacecraft products, certain smaller amounts totalling less than ECU 1 billion and import surpluses of ECU 2.6 billion for computers, ECU 0.6 billion for electronic components and ECU 0.6 billion for consumer electronics. The export-import quotient of France's foreign trade in HTP was slightly over 1 in the reference period and just under 1 with its EU partners. France achieved high to very high quotients with EFTA, the NICs6 countries and the NICs9 countries, but low ones with the USA and Japan. Telecommunications and weapons were two product groups in which France achieved very high quotients; those for aircraft and spacecraft products, nuclear energy technology and machinery were considerably lower, but still above 1.0.

France's import specialisation was well above average, particularly in aircraft and spacecraft products, nuclear energy technology, chemicals and scientific instruments. It was very low in the weapons branch. Its export specialisation was even more marked: here, too, aircraft and spacecraft products and nuclear energy technology were responsible for the above-average index values, while telecommunications and electronic components were also above average, but only slightly more than 1.0. All other areas were below average.

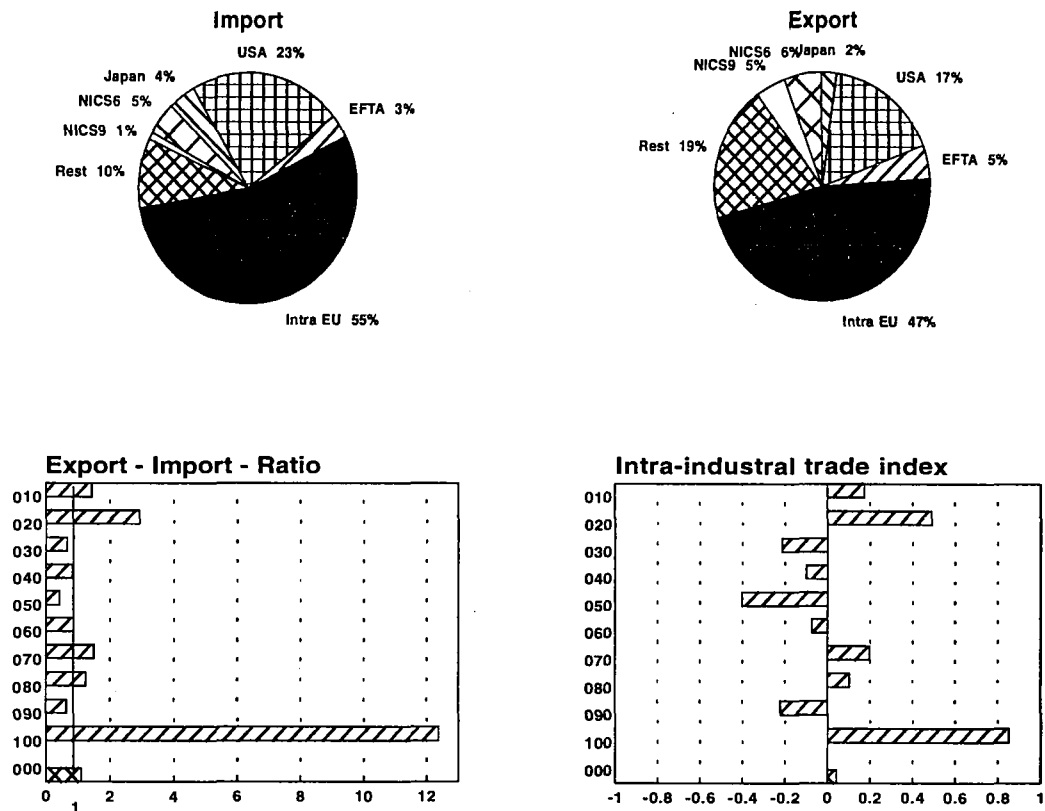

France's intra-industrial trade specialisation was even greater than that of Germany. Here, too, there was a balancing-out between the USA and Japan (values above zero) and EFTA, the NICs6 countries and the NICs9 countries (values below zero), but the deviations from zero were appreciable only for the NICs9 countries. Intra-industrial trade with EU partners was more or less balanced, i.e. extremely intensive.

M und X, A. 4.4 im Anhang.

Belgo-Luxembourg Economic Union

The HTP imports of the Belgo-Luxembourg Economic Union amounted to ECU 3.7 billion in 1993, divided between intra-EU imports of ECU 2.1 billion (58%) and imports from the USA (27%), Japan (6%), the NICs6 countries (4%) and EFTA (3%) (Fig. 22).

The most significant main product group, accounting for over two-fifths of total imports, was computers and office equipment. This group was responsible for over 50% of imports from other EU Member States and in several years for over 60% of imports from the NICs6 countries. Computers and consumer electronics accounted for a third each of imports from Japan. Imports of aircraft and spacecraft products were not a significant part of Belgium and Luxembourg's HTP imports, but were the biggest main group of imports from the USA.

The Belgo-Luxembourg Economic Union's HTP exports amounted to a total of ECU 2.4 billion in 1993 - a substantial increase over previous years. Four-fifths were to the rest of the EU, 8% went to the USA and 3% to EFTA. The Asian market was insignificant in the reference period.

Computers and office equipment also dominated exports, particularly where supplies to EFTA and Japan were concerned (although the volume of the latter was insignificant). Electronic components found a good market in the NICs6 countries and the USA was an important customer for aircraft and spacecraft products.

The role of Belgo-Luxembourg as a net importer of HTP is reflected in all ten main product groups, sometimes to a huge extent. Export-import quotients thus fell under 1.0 to varying degrees, the most extreme being that with Japan (less than 0.1). Different product groups showed different quotients, but none are worth mentioning.

Import specialisation too showed index values consistently under 1.0, but in the telecommunications, consumer electronics and chemicals branches the values were around 0.8 to 0.9. Groups such as aircraft and spacecraft products, nuclear energy technology and weapons were usually under 0.2. Export specialisation was even further below average, but here too there were structural differences.

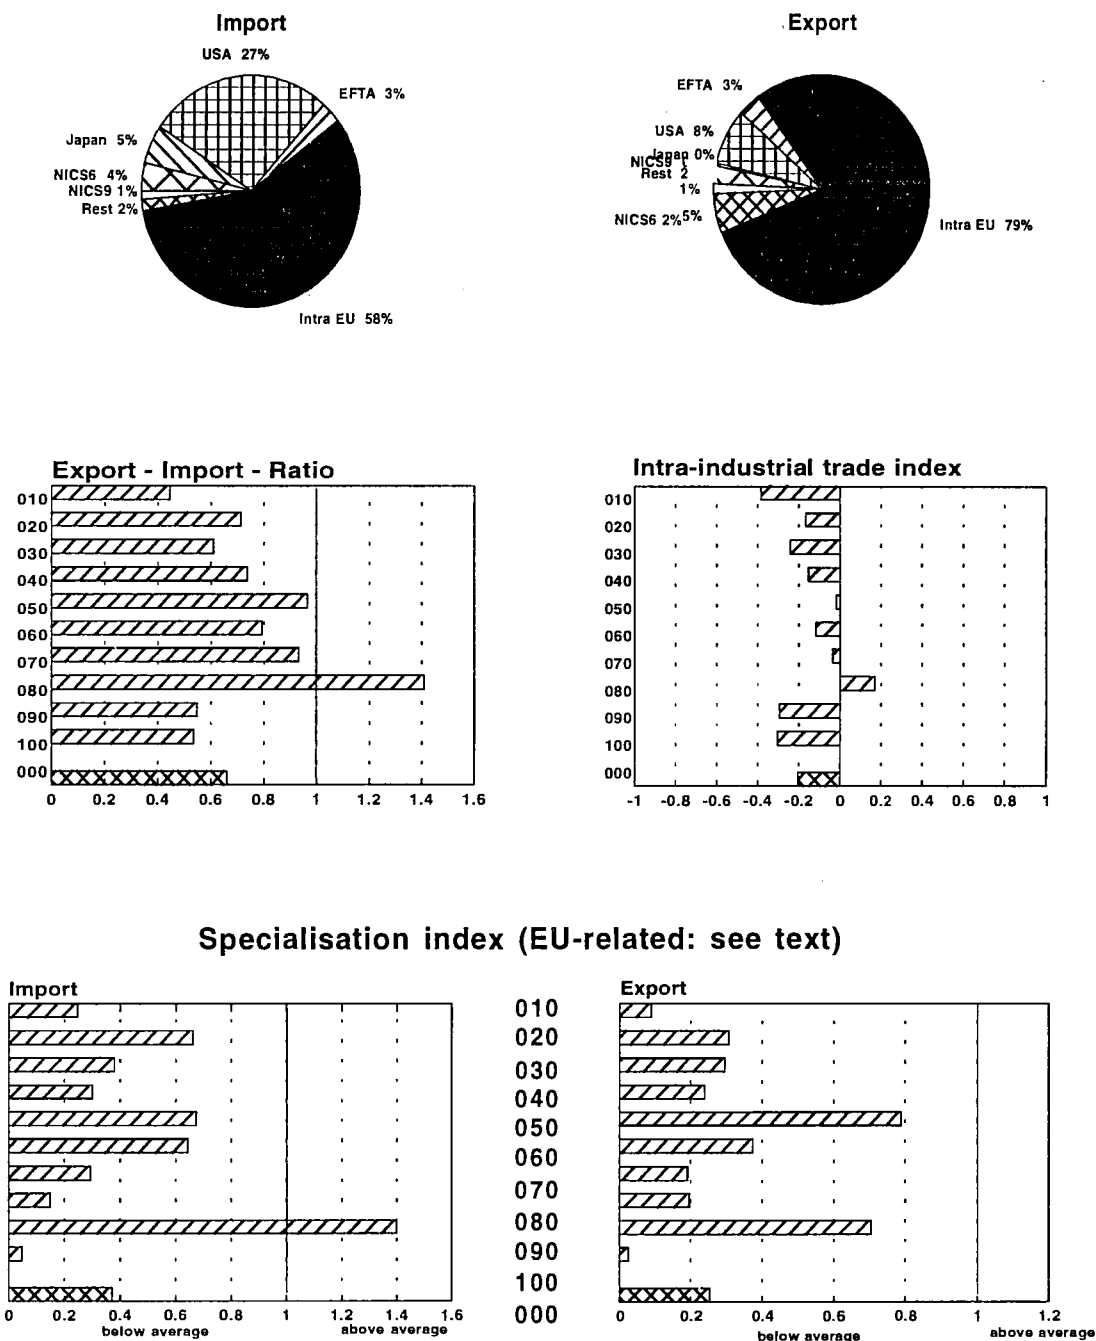

Intra-industrial trade with all partners was fairly unbalanced, particularly with Japan and the USA, and in all product groups.

M and X, A. 4.4 in annex.

Netherlands

Netherlands HTP imports amounted to ECU 11.1 billion in 1993. 45% came from the EU, 23% from the USA, 10% from Japan and 11% from the NICs6 countries (Fig. 23).

The import structure revealed a strong concentration on computers and office equipment, which accounted for some 60%. Supplies from the USA and EFTA were below this average. Aircraft and spacecraft supplies from the USA were appreciable. The demand for electronic components was weak, and these accounted for only 10% of imports.

The Netherlands' HTP exports exceeded their imports in 1993, with a value of ECU 12.2 billion - a result which had not been achieved in previous years. The main markets for Netherlands exports in 1993 were the USA (9%) and EFTA (6%). 10% went to other countries or were not recorded.

The export structure by main product group shows, as with imports, that computers and office equipment dominate, accounting for roughly half of Netherlands HTP exports, but are tending to fall. The EU and EFTA were the main markets. Exports to the USA were primarily of aircraft and spacecraft products, as were those to the NICs9 countries. The NICs6 countries were also significant purchasers of electronic components.

The balance within main product groups showed that, in 1993, export surpluses were achieved, *inter alia*, with aircraft and spacecraft products (ECU 1.0 billion) and scientific instruments (ECU 0.5 billion). These were countered by import surpluses of ECU 1.1 billion in computers.

The export-import quotient was over 1.0 for trade with other EU Member States, EFTA and the NICs9 countries, but was so low for trade with the USA, the NICs6 countries and above all Japan (less than 0.1) that even the positive trade balance of 1993 brought no change.

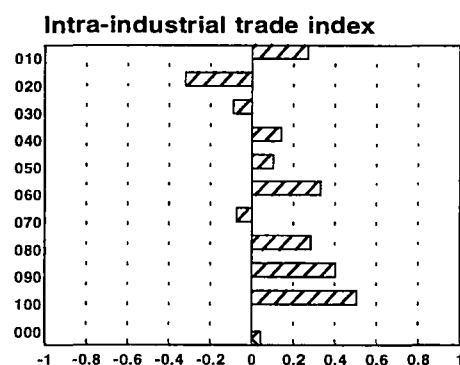

Specialisation in Netherlands imports was only slightly above average for the entire HTP range, and particularly in main product groups such as consumer electronics, computers and office equipment and scientific instruments. Export specialisation showed values of around 1.0, with computers, consumer electronics, scientific instruments and chemicals above average.

Intra-industrial trade intensity was high in general, particularly with the EU partners, but the very uneven negative trade balances with the USA, the NICs6 countries and above all Japan could not be counterbalanced by positive trade figures with EFTA and the NICs9 countries.

Specialisation index (EU-related: see text)

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A. 4.4 in annex.

Italy's HTP imports amounted to ECU 9.8 billion in 1993, having risen up to 1991, remained stable and then fallen sharply. 57% of imports came from other EU Member States, 16% from the USA, 5% from EFTA, 7% from the NICs6 countries and 6% from Japan. Over 80% of imports in 1993 were in the three main product groups: computers and office equipment (41%), electronic components (26%) and aircraft and spacecraft products (15%). Much of the latter came from the USA and EFTA, but computers and office equipment headed the list of supplies from Japan, the NICs9 countries and above all the NICs6 countries (Fig. 24).

Italy's HTP exports amounted to ECU 7.7 billion in 1993, continuing its high import surplus. 53% of exports in 1993 went to other EU Member States, 8% to EFTA and 10% to the USA. Japan, at 2% was a much weaker market than the NICs6 and NICs9

countries (4.6% and 3.9%) and other European Mediterranean countries which are not in the EU. Computers dominated Italy's HTP exports in 1993 at 44%, followed by aircraft and spacecraft products (20%) and electronic components (20%). The main product group computers and office equipment showed above-average exports to other EU Member States and to Japan (though here with only a small export value). Exports to the USA and EFTA consisted largely of aircraft and spacecraft products.

In view of the large import surplus in total HTP trade, it is hardly surprising that most of the main product groups showed import surpluses of various sizes. The sole exceptions, but at almost negligible values, were nuclear energy and weapons.

Only about two-thirds of imports were covered by exports. The export-import quotients with the USA, Japan and the NICs6 countries were considerably smaller, although there was some improvement over the period. The quotients changed so radically from year to year in some main product groups that no meaningful comments are possible. The quotient for computers and office equipment fell; those for telecommunications, consumer electronics, electronic components and scientific instruments were fairly stable and the quotient for consumer electronics was very low (0.2 maximum).

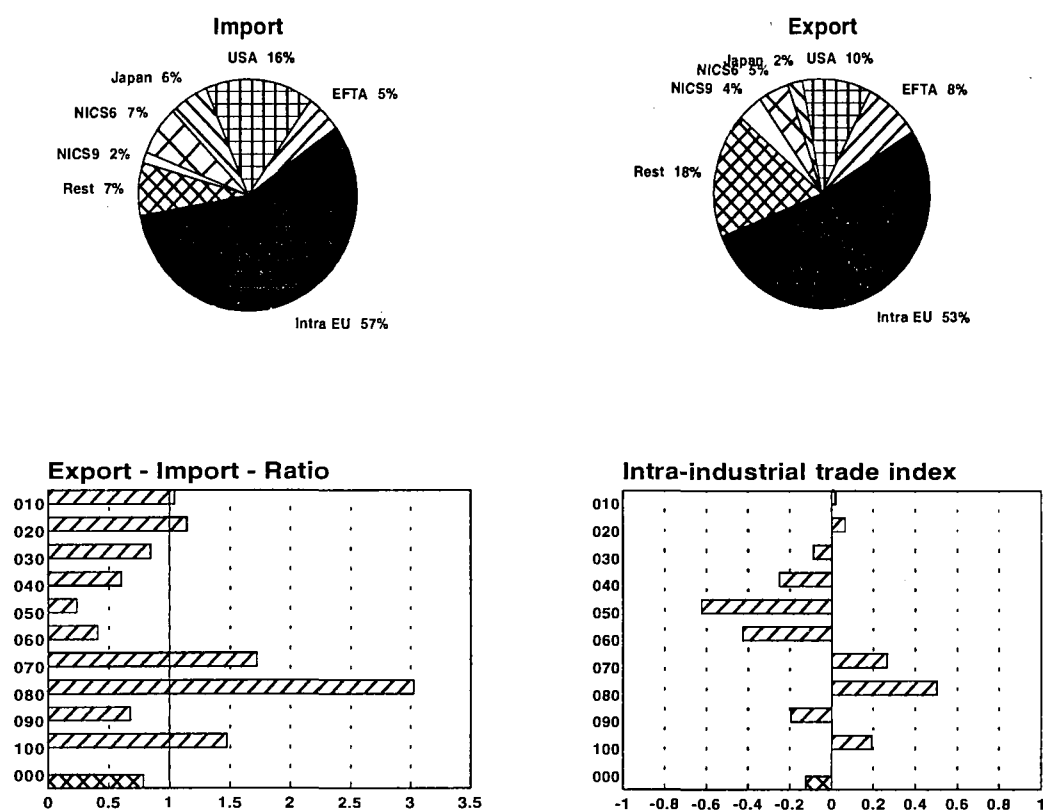

The weight of HTP imports as a whole was well below the average for total imports. Only with electronic components and chemicals was specialisation above average. The index values for export specialisation were also below average. The huge rise in weapons over the period is a result of very small values, the trend in which is largely a matter of chance.

The values for intra-industrial trade intensity also illustrate Italy's overall trade deficit in HTP. A positive balance was achieved only with the NICs9 countries and with EFTA, the figures with the latter being largely in balance. A high intensity was shown in the main groups aircraft and spacecraft products, computers and machinery.

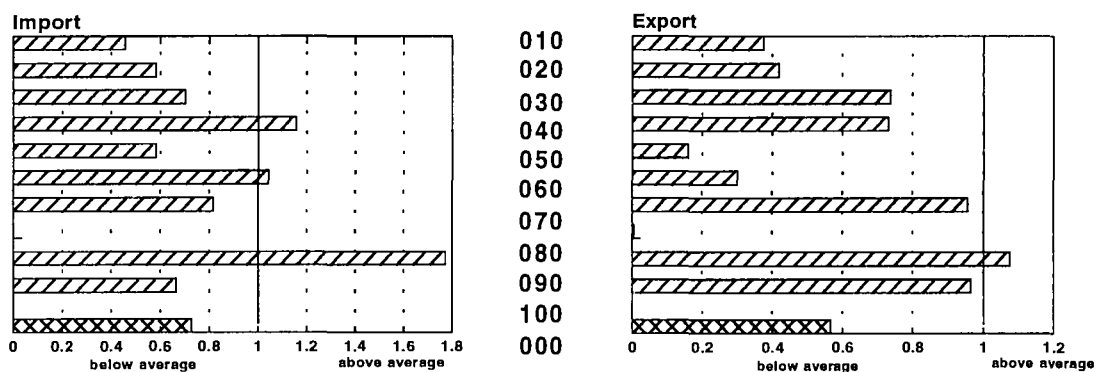

Fig. 24

Country data for foreign trade in HTP: Italy 1993

Shares of partner countries

Specialisation index (EU-related:see text)

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A. 4.4 in annex.

British imports of HTP amounted to ECU 24.5 billion in 1993 - a steep increase over previous years. 63% of imports came from non-Member countries; of these, 25% were from the USA, 11% from Japan and 13% from the NICs6 countries. 10% came from other countries (Canada) or from unrecorded sources (Fig. 25).

Computers dominate the structure of UK HTP imports too, at 48% in 1993. The other noteworthy items were aircraft and spacecraft products at 17% and electronic components at 20%. Imports from other EU Member States were largely of computers, as were those from other countries and regions, although aircraft and spacecraft products also played an appreciable role in imports from the USA and the NICs9 countries; electronic components as well as computers were significant imports from Japan and the NICs countries.

At a value of ECU 21.2 billion, the United Kingdom's exports of HTP remained clearly below its imports in 1993, as in previous years, when they showed a slight decline. 52% went to other EU Member States and 18% to the USA; of the remainder, 2% went to Japan, 5% to the NICs6 countries, 3% to the NICs9 countries and 4% to Canada, South Africa, Australia and New Zealand combined.

The main product group was computers and office equipment, followed by aircraft and spacecraft products. Aerospace dominated exports to the USA and computers and office equipment, at 60%, supplies to EU partners and EFTA countries. Electronic components also found a good market in the NICs6 countries.

The source of the United Kingdom's import surplus is the electronics sector: computers and office equipment, electronic components and consumer electronics. Export surpluses were achieved in all other main product groups, at least in most years.

The export-import quotient in British foreign trade showed a downturn, and a deficit since 1990. This was, as mentioned above, attributable to the three electronics sectors, since values of over 1.0 were achieved in all other products.

The specialisation indices were very high in both imports and exports. In imports, only scientific instruments and chemicals were below average (wide fluctuations in aircraft and spacecraft products). No export sector showed a constantly below-average specialisation.

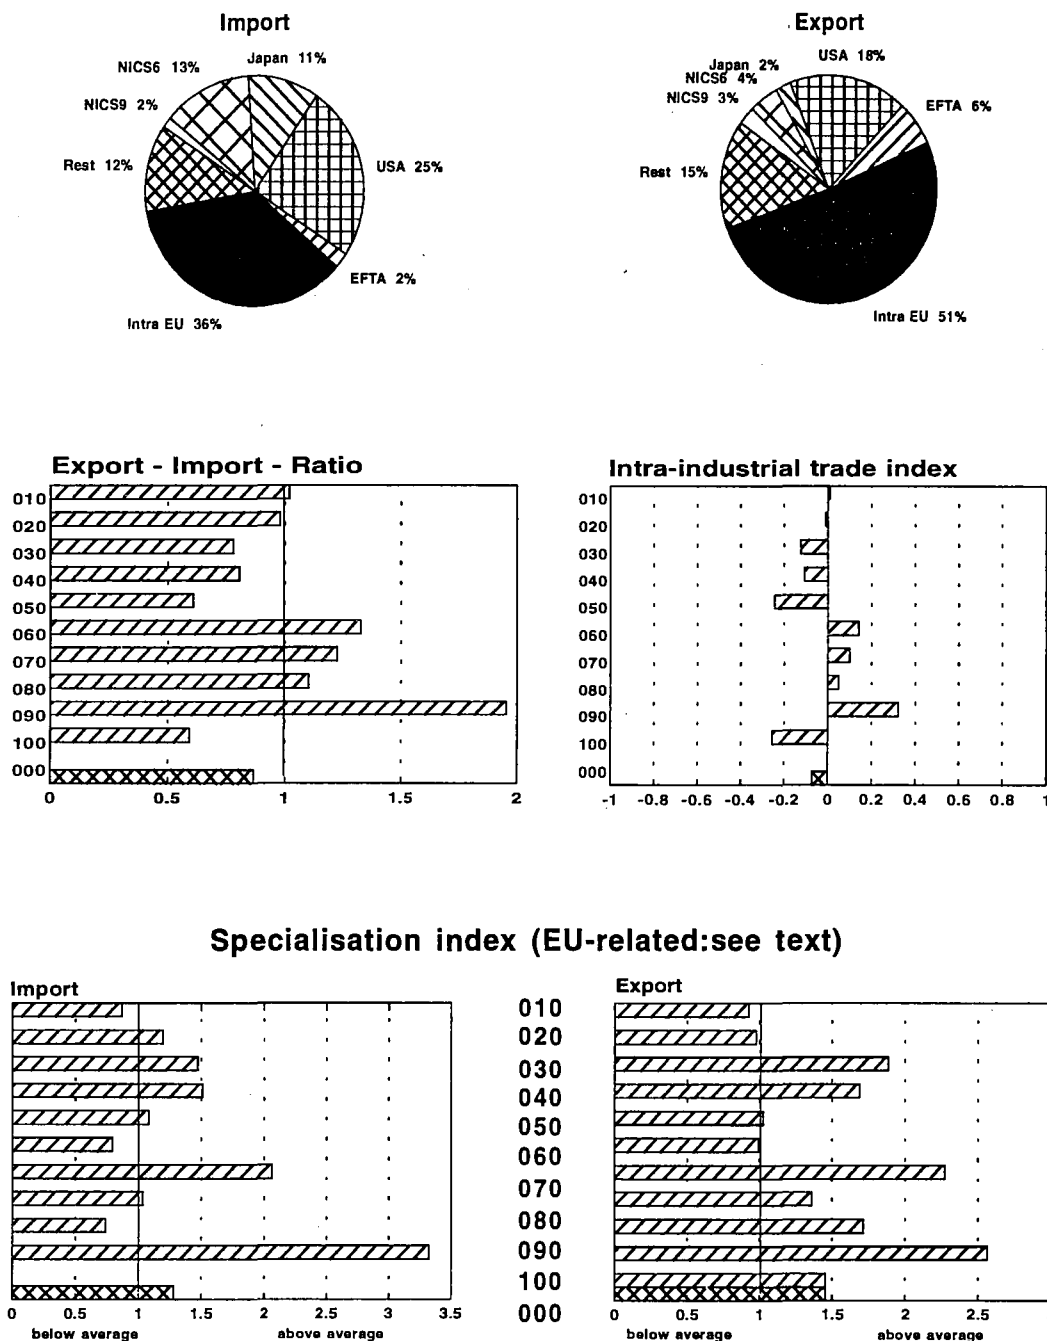

UK intra-industrial trade was largely well-balanced both overall and with the EU partners. In total, however, the export surpluses with EFTA and the NICs9 countries only just counterbalanced import surpluses with the USA, the NICs6 countries and above all Japan. Most product groups showed a balance or a high intra-industrial trade intensity, but to varying degrees.

Fig.25

Denmark

Denmark is one of the smaller EU Member States in terms of its foreign trade in HTP, but all main product groups and almost all trading partners recorded imports or exports. Imports amounted to ECU 2.0 billion in 1993, 65% of which remained in the EU, 15% went to the USA, 7% to EFTA, just under 6% to the NICs6 countries and 5% to Japan (Fig. 26).

Denmark, too, shows the familiar dominance of computers and office equipment in its import structure, particularly where imports from other Member States, Japan and above all the NICs6 countries are concerned. Imports from the USA were chiefly of aircraft and spacecraft products until 1992, when their share, plus their absolute import value and all HTP imports from the USA, dropped drastically in favour of several other main product groups.

HTP exports amounted to ECU 1.2 billion in 1993 - a considerable drop compared with previous years, making Denmark a net importer of HTP. Two-fifths of exports in 1993 were intra-EU and three-fifths extra-EU. The EFTA market (Scandinavia) was of particular interest to Danish exporters, purchasing more than a quarter of all their exports. The USA at 12%, the NICs6 countries at 4% and the NICs9 countries at 3% lagged well behind. Here, too, other countries (state-trading countries, Australia, Canada and South Africa) and unrecorded destinations purchased as much as 12%.

The export structure by product group is more varied than that of any other Member State. The high proportion - 25% - of aircraft and spacecraft products until 1992, almost level with computers at 30%, is particularly surprising. In 1993 this high proportion of aircraft and spacecraft products fell drastically back to 10%: the purchasing capacity of the EU and EFTA had suffered badly. Apart from aircraft and spacecraft products and computers and office equipment, however, electronic components and consumer electronics together played an appreciable role, at 45%. Computers were the biggest export item to other EU Member States, followed by electronic components and scientific instruments; computers led exports to EFTA, while aircraft and spacecraft products once again dominated exports to the USA, ahead of computers and scientific instruments.

Denmark's foreign trade balance by main product group showed that imports had originally exceeded exports in aircraft and spacecraft products, but that this had changed over the reference period. The opposite was true of consumer electronics. Computers and office equipment and electronic components showed persistent import surpluses, while scientific instruments achieved export surpluses. The figures were reasonably balanced in recent years, except with computers.

The balance structure is also evident in the export-import quotients, but it should be pointed out that the large quotients of chemicals (over 3.0) were calculated from very small foreign trade flows. This purely arithmetic phenomenon severely undermines the use and assessment of indices for small countries with small absolute foreign trade figures.

The only comments worth making about the specialisation indices are therefore that specialisation in imports was somewhat below average, but that computers and office equipment achieved more than 1.0 during the reference period, while exports of HTP as a whole reached index values of less than 0.6.

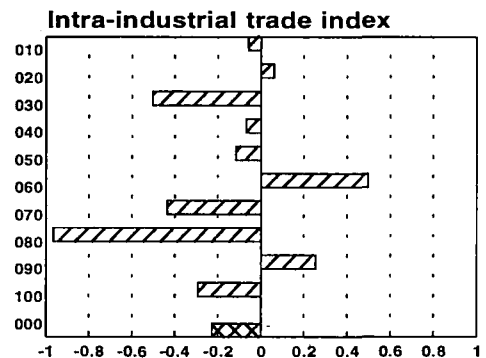

Intra-industrial trade intensity was well below that of the large EU Member States. Moreover, large discrepancies are noticeable in most main product groups from year to year, which suggests that the figures on which they are based were subject to strong random fluctuations.

M and X, A. 4.4 in annex.

Ireland

Irish high-tech imports were somewhat larger than those of Denmark in 1993, at ECU 3.5 billion. Over the reference period they first remained at around ECU 2.4 billion, but rose sharply in 1993. Extra-EU imports alone grew from ECU 1.3 to 2.2 billion. The main suppliers in 1993 were the EU partners with a total of 37%, the USA at 32%, Japan at 14% and the NICs6 countries at 15%. The heavy non-EU bias (over 60%) is remarkable, but is probably explained by the fact that Ireland is known elsewhere as well as in the EU as an economical production site.

Imports were chiefly of computers, with above-average contributions from Japan and the NICs6 countries. Computer supplies from the EU were in line with the overall average, and electronic components also played a part. Imports of this main product group were primarily from Japan and the NICs9 countries (although the latter were on a very small scale).

Exports amounted to ECU 6.1 billion in 1993 - considerably higher than imports. The other EU Member States were the main export destination, taking 64%. EFTA purchased a further 7%, so that over 70% of Ireland's exports remained in Western Europe. The USA's share was 12%. Ireland's HTP exports may well have consisted substantially of imported goods processed in Ireland (added value). The non-EU sources of imports together with the high proportion of exports to the EU suggest that Ireland is viewed as a door to the European Union.

Some 70% of Ireland's HTP exports were of computers and office equipment, and these went fairly consistently to the EU, EFTA, the USA and Japan. Consumer electronics were also significant, particularly as supplies to EFTA.

Ireland's export surplus consists of computers, consumer electronics and - on a very small scale - scientific instruments. Aircraft and spacecraft products, general electronics and machinery (very small-scale) show import surpluses.

Ireland's export-import quotient was unusually high for the EU in the reference period, at almost 2.0. It was made up of two-digit figures with EFTA, above-average quotients in trade with other EU partners and the NICs9 countries (with very small absolute values) and - as a counterbalance - relatively small quotients from the trade deficits with the USA, Japan and the NICs6 countries. The inward processing assumed to account for Ireland's favourable foreign trade figures is probably concentrated in the consumer electronics sector, in which export figures were ten to twenty times those of imports in the reference period.

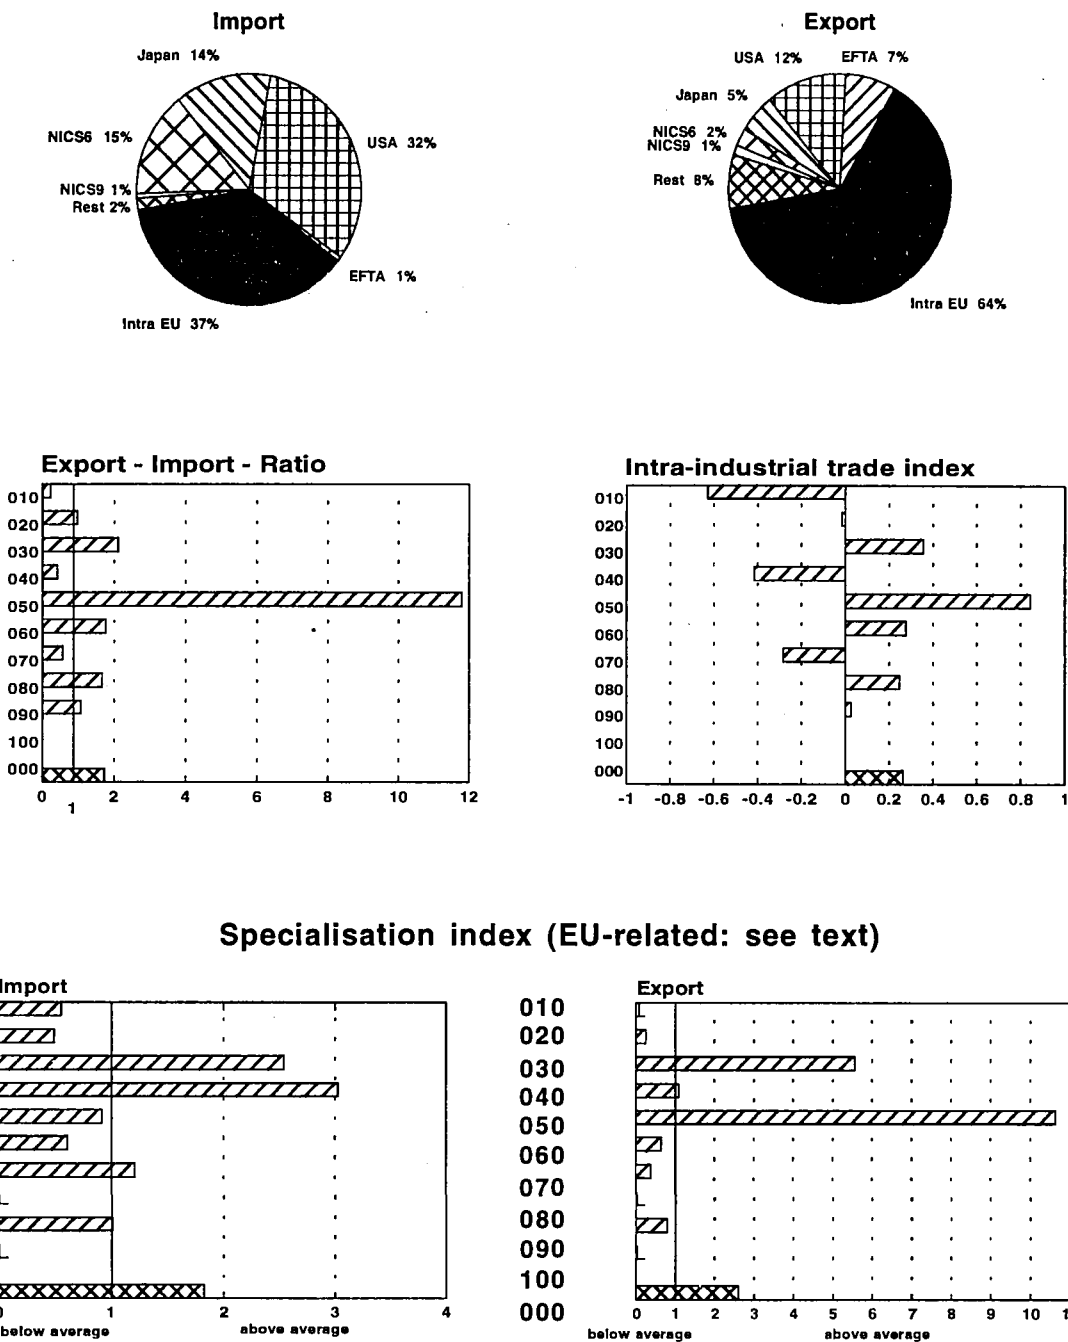

Ireland's specialisation index, above average for total imports of HTP and resulting from the computer, electronic component and machinery situation, was again below average for consumer electronics (0.9) after a steep increase in previous years. On the export side it was extremely high in this sector (1993: 10.6). Computers, electronic components, machinery and in some years scientific instruments also recorded figures of over 1.0.

Ireland's intra-industrial trade intensity is very low (roughly level with that of Belgium and Luxembourg taken together). The obvious concentration of Irish foreign trade on a few product sectors suggests that imports and exports are high in these products but involve different partners, so that no intra-industrial trade takes place.

Fig. 27

M and X, A. 4.4 in annex.

Spain

Spain's HTP imports were valued at ECU 4.8 billion in 1993 - the lowest figure in the reference period, following a strong rise in 1991. 62% of imports came from the EU in 1993, 24% from the USA and 4% from the NICs6 countries (Fig. 28).

Computers and office equipment accounted for well over 40% of imports in the reference period, and aircraft and spacecraft products for a further 20% (almost 30% in previous years). Computers dominated imports from other EU Member States, aircraft and spacecraft products those from the USA and computers and consumer electronics imports from Japan, while almost four-fifths of imports from the NICs6 countries were of computers.

Spain's HTP exports were well below its imports in 1993, at ECU 2.3 billion. 52% of exports went to other EU Member States and 7% to EFTA. As with Ireland, export patterns showed a bias towards imports from non-EU countries and a bias towards exports to Europe. The USA at 7% and the NICs9 countries at 15% were further markets.

In 1993, almost 40% of Spanish exports were of computers and 25% aircraft and spacecraft products. The EU Member States were a market for computers and office equipment above all; the USA became an appreciable customer for these products only in 1993, before which aircraft and spacecraft products had dominated Spain's exports to both the USA and, in most years, to the NICs9 countries.

The trade balance was very even in that almost all main product groups showed clear import surpluses of various sizes.

Spain's export-import quotient also shows a severe deficit in its foreign trade in HTP. Only five main product groups are of any significance when examined closely: aircraft and spacecraft products, electronics and possibly scientific instruments. EFTA and the NICs9 countries were insignificant as trading partners. The failure of exports to cover imports was particularly evident with consumer electronics and scientific instruments, and particularly with the USA and Japan.

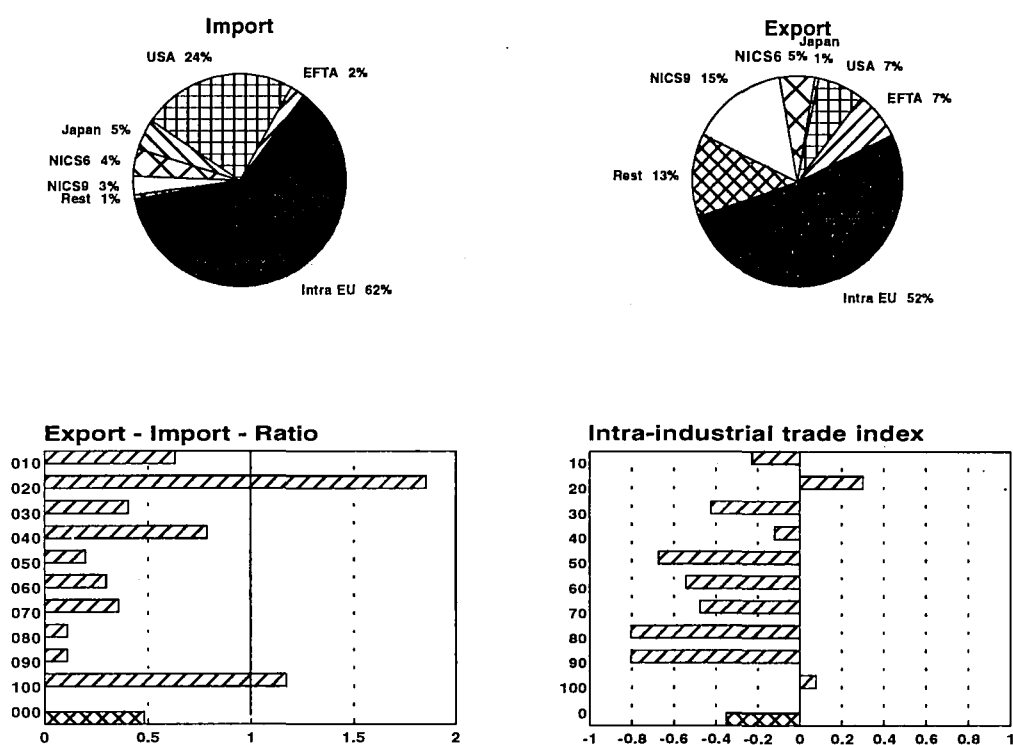

Import specialisation was somewhat below average, and export specialisation very much so. Intra-industrial trade intensity was also very low.

Fig.28

M and X, A. 4.4 in annex.

Portugal

Portugal's HTP imports were small compared with those of the other EU Member States, at ECU 0.98 billion in 1993, but they had increased between 1989 and 1992 before falling markedly in 1993. The EU was Portugal's main supplier in 1993, at 76%; the USA accounted for 10%, and EFTA, the NICs6 countries and Japan for roughly 4% each (Fig. 29).

Since imports of aircraft and spacecraft products are small-scale, there were two dominant product groups: computers and office equipment, accounting for roughly half, and electronic components, at just a fifth. This weight distribution is also seen in imports from the main suppliers.

Portugal's HTP exports were far behind its imports over the entire reference period, in 1993 achieving their lowest value since 1989, at ECU 185 million. Just under three-quarters of exports went to the EU in 1993, 5% to EFTA and 4% each to the USA and the NICs6 countries.

Roughly half of Portugal's exports were of electronic components. Computers and office equipment (over 20%) and aircraft and spacecraft products (around 15%) also played a role. Exports to other Member States consisted mainly of electronic components, as did trade with EFTA customers, whereas exports to the USA were chiefly of computers in recent years.

Portugal showed import surpluses not merely overall, but in all main product groups. Its imports of HTP were "financed" by imports only to a very small extent. Its quotient with the USA fell very steeply over the reference period, while that with the EU fell somewhat less.

The import specialisation index was below average at just under 0.5; that of exports was even smaller, the latest figure being 0.15. Portugal's values for the intra-industrial trade index, -0.5 to -0.7, were a sign that it has scarcely any HTP exports.

Greece

Greece's foreign trade in HTP is the smallest in the EU. Imports of nuclear energy and weapons and exports of chemicals are virtually negligible.

Imports amounted to ECU 768 million in 1993, 57% of which came from the EU, 18% from the USA, 7% from the NICs6 countries and 4% from Japan. Imports have risen sharply since 1989, with a fall-off in 1992.

Most imports were of computers and office equipment and aircraft and spacecraft products. Electronic components and scientific instruments also played a part. Supplies from the EU reflected total imports. Imports from the USA were chiefly of aircraft and spacecraft products, with annual fluctuations, and of computers. Computers clearly dominated supplies from the NICs6 countries.

Of Greek HTP exports, valued at ECU 42 million in 1993, 39% went to other EU Member States, 11% to EFTA, 8% to the USA, 3% to the NICs9 countries and 21% to state-trading countries. Exports are totally insignificant compared with imports. Insofar as it is worth mentioning any individual main product groups, the main sectors, as with other countries, were aircraft and spacecraft products, computers and office equipment and electronic components.

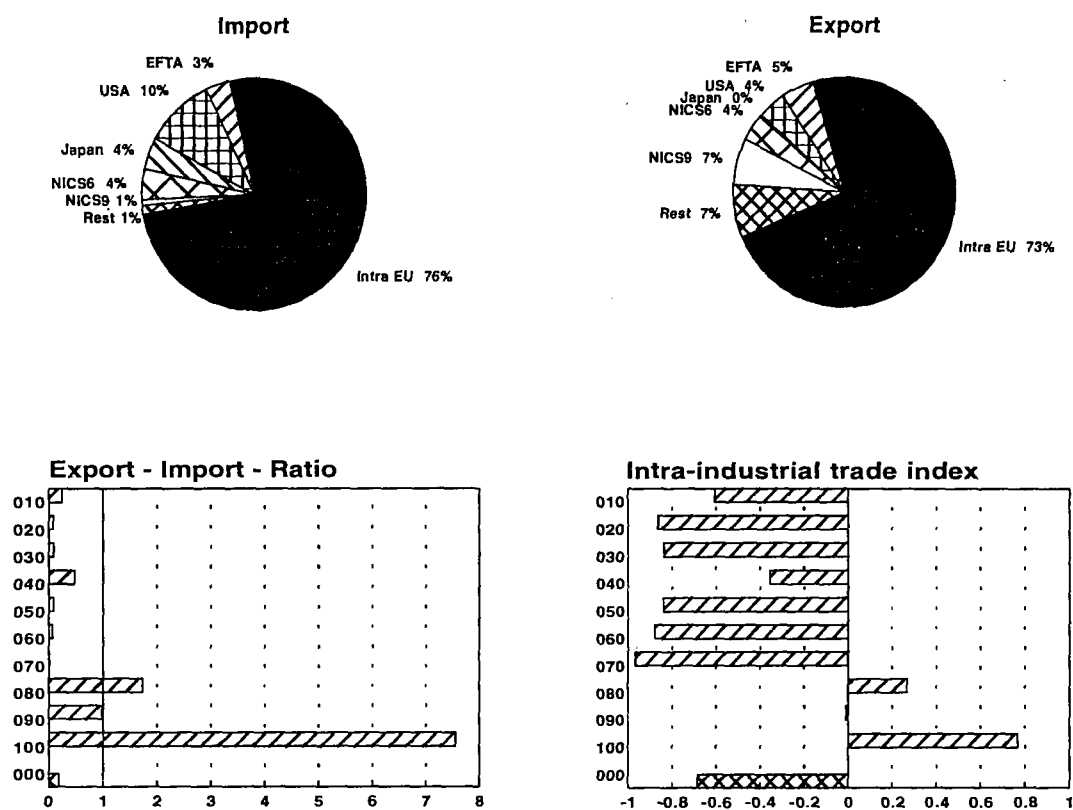

The preponderance of imports over exports applied to all main product groups. The average export-import quotient of less than 0.1 in Greece's foreign trade in HTP shows that the country does engage in some foreign trade, but that any attempt to calculate indices with such a discrepancy between import and export figures will yield meaningless results. Index values for intra-industrial trade of -0.9 or more in all directions show that, in practical terms, there was no export of HTP. No country graph has therefore been prepared.

Fig.29

Country of foreign trade in HTP: Portugal

M and X. A. 4.4 in annex.

3.4 The EFTA area

The order in which the EFTA countries are dealt with reflects the fact that Austria, Sweden and Finland joined the EU on 1 January 1995. They therefore appear immediately after the existing EU Member States.

In 1993, EFTA imports amounted to ECU 14.8 billion and exports to ECU 8.4 billion, giving an import surplus of ECU 6.4 billion (Fig. 30). The three main product groups on the imports side in 1993 were computers and office equipment, general electronics and aircraft and spacecraft products (Table 2), and on the exports side also computers, electronic components, scientific instruments and machinery, plus aerospace products (Table 5). The main trading partners were the EU and the USA for imports (Table 3) and the EU, the USA and EFTA partners for exports (Table 6). EFTA imports from EFTA partner countries were remarkably scarce, at 5%.

3.5 EFTA countries with indices

Austria

Austrian HTP imports amounted to ECU 2.8 billion in 1993 - a fall-off from 1992 levels, following a marked increase totalling 18% since 1989. 48% (1993) came from the EU, 21% from the USA, 12% each from Japan and the NICs6 countries and only 4% from other EFTA countries. There is a marked non-European trading tendency (Fig. 31).

The main product groups computers and office equipment (just under 50% on average) and electronic components (over a fifth) were important throughout the reference period. An above-average share of these computer imports came from outside the EU, particularly from the NICs6 countries and the USA. Electronic components, though at a far lower value, were significant imports from the EU, EFTA and the NICs6 countries.

Austria's high-tech exports were valued at ECU 1.5 billion in 1993 - a slight fall-off compared with the years before and only just over half the value of its 1993 imports. Three-fifths of Austria's 1993 exports went to the EU area, 7% to EFTA and 13% to former state-trading countries.

Fig. 30

Fig.31

Country data for foreign trade in HTP: Austria 1993

Shares of partner countries

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A. 4.4 in annex.

Roughly four-fifths of Austria's exports were of electronic products. Electronic components headed the list, followed by computers and, a long way behind, consumer electronics. Machinery played a significant role in supplies to certain markets (Japan). Exports to the EU and EFTA were chiefly of electronic components and computers, and computers were the main export to the USA.

Austria's foreign trade balance by main product group yielded import surpluses in most groups, as expected, but these were surprisingly small in certain areas (e.g. electronic components, a possible inward processing item), or alternated with export surpluses over the reference period (telecommunications, machinery).

Austria's export-import quotient showed clear deficits with all significant trading partners, but its position with the EU was considerably above average. HTP trade with the USA, Japan and the NICs6 countries was particularly unbalanced, however. Austria's position was particularly weak in aircraft and spacecraft products, chemicals, computers and scientific instruments, but relatively strong in machinery and telecommunications (both at very low absolute values).

Import specialisation was below average, but this was due primarily to zero values for weapons and nuclear energy: of the other product groups, only aircraft and spacecraft products were particularly below average. The indices in many areas were just under or just over 1.0. The export side showed a similar pattern, but with more extreme index results.

Intra-industrial trade was most balanced with the EU. The results showed particularly drastic deficits with the USA, Japan and the NICs6 countries.

Sweden

Sweden's HTP imports amounted to ECU 4.2 billion in 1993, a slight increase over 1992 but still below the 1989-1991 levels. The EU supplied 38%, EFTA 6% and other countries well over 50% (USA 34%, Japan 11%, the NICs6 countries 8%) (Fig. 32).

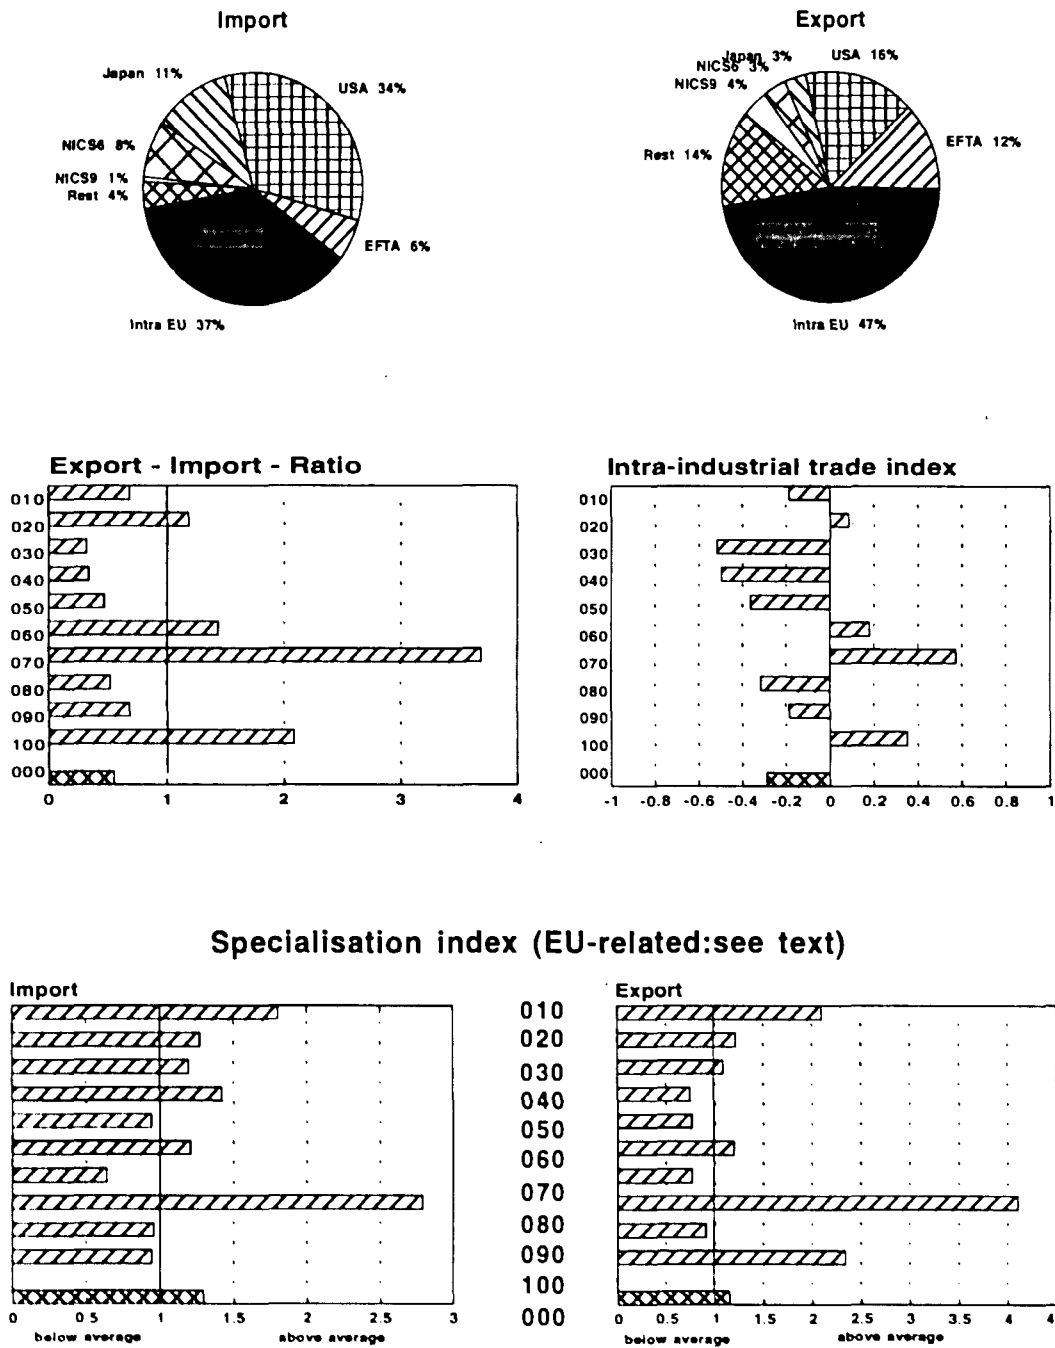

Computers and office equipment once again dominated HTP imports, followed by aircraft and spacecraft products and electronic components in roughly equal proportions. Of supplies from the USA, aircraft and spacecraft products came close behind computers; of those from the EU, only computers and electronic components were of any significance until 1993, when aircraft and spacecraft products appeared in significant quantities.

Sweden's HTP exports in 1993 were only just over half the value of its imports, at ECU 2.3 billion, having shown a constant decline since 1989, when they were already 11% below imports. The EU share of exports was 50% in 1993, 13% went to other EFTA countries, 18% to the USA, over 3% to Japan and some 8% to the NICs15 countries.

Fig.32

Country of foreign trade in HTP:
Sweden
1993

Shares of partner countries

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A. 4.4 in annex.

Computers and office equipment headed the list of exports, but far less so than in other countries, since aircraft and spacecraft products and, to an increasing extent, scientific instruments were also significant. Computers dominated exports to the EU and aircraft and spacecraft products those to the USA.

Sweden's trade balance by main product group shows import surpluses in the three electronics branches, in aircraft and spacecraft products and also in nuclear energy, and fairly small export surpluses in scientific instruments, telecommunications equipment and high-tech machinery. Weapons exports were also well ahead of imports, with only the non-EU area indicated as trading partners in both cases.

The export-import quotient had fallen constantly as a result of the decline in exports over the reference period. This applied above all to the EU and to Sweden's EFTA partners. The quotient achieved with the USA and Japan fluctuated without showing a clear upward or downward trend. Positive figures were achieved in telecommunications, scientific instruments and machinery, but fairly high deficits in the three electronics groups.

Import specialisation was above average for HTP as a whole, particularly with aircraft and spacecraft products, telecommunications, computers and scientific instruments. Specialisation was even more marked in exports; the above-average items were the same as with imports.

Intra-industrial trade with the EU Member States was fairly balanced, although the results deteriorated in 1993. The position vis-à-vis the USA, the NICs6 countries and above all Japan was very uneven, however, as has been reported for numerous other countries. In some product groups the results fluctuated wildly from year to year. The aircraft and spacecraft product situation was relatively favourable, as was that with scientific instruments, though with a small turnover.

Finland

Finnish HTP imports amounted to ECU 1.7 billion in 1993 - a slight increase since 1991. The EU accounted for only 30%, the USA for 27%, the NICs6 countries for 19% and Japan for 15%. The EFTA partners supplied only 5% (Fig. 33).

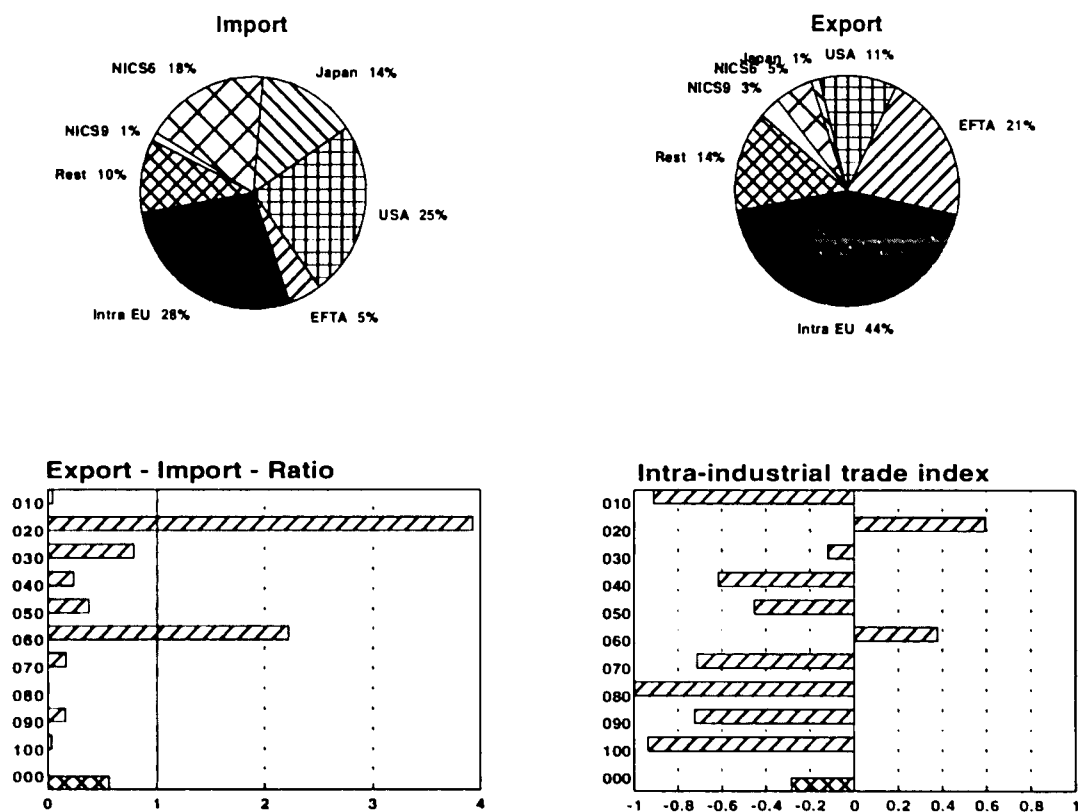

The well-known predominance of computers and office equipment and electronic components is once again found here, but weapons (with gaps in the declaration of origins) and, in some years, aircraft and spacecraft products are further significant import items. Supplies from the EU reflect the total import structure, computers head the list of imports from the US with aircraft and spacecraft products in second place, and computers play an above-average role in supplies from Japan and the NICs6 countries.

Following a downturn in 1991, Finland's HTP exports increased, reaching ECU 926 million in 1993. Finland is thus another net importer of high-tech goods. With a 44%

Fig.33

Country data for foreign trade in HTP: Finland 1993

Shares of partner countries

Specialisation index (EU-related: see text)

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A. 4.4 in annex.

share, the EU was a far more significant trading partner for exports than for imports. This applied even more strongly to Finland's EFTA partners, which accounted for 21%. The USA at 11% and the NICs6 countries at 5% were next in line; the former state-trading countries took 10%.

Computer exports increased their share by a third over the reference period, reaching almost 60% in 1992 and 1993 (main markets: the EU and EFTA). Scientific instruments also played a fairly large part, with the USA the main customer after the EU.

Finland achieved certain export surpluses in two main product groups: telecommunications products and scientific instruments. Its import surpluses in computers and office equipment and in consumer electronics diminished. Finland was a net importer of all other product groups, with no sign of change.

The export-import quotient was thus low. The trend in scientific instruments is worth mentioning, since its share increased markedly in the reference period, though with fairly low turnover figures. The same applied on a fairly large scale to computers and office equipment, whose quotient rose from 0.25 in 1989 to 0.79 in 1993.

Import specialisation was a little above average. There was far less export specialisation, however, reaching a stable above-average value only with scientific instruments.

Finland's intra-industrial trade in high-tech products is not highly developed. The index values showed substantial imbalances in all directions.

Switzerland

Switzerland's HTP imports in 1993 totalled ECU 4.4 billion. Over the reference period, they first increased to ECU 4.8 billion in 1991, after which they fell to ECU 4.3 billion and finally picked up again slightly. Two thirds came from the EU (1993), 17% from the USA and around 6% each from the NICs 6 group. Only 3% came from EFTA (Fig. 34).

Computers and office equipment, general electronics and - with wide fluctuations - aircraft and spacecraft were the main product groups. Imports from the EU more or less followed the overall pattern, but consumer electronics and scientific instruments also contributed. Imports from the USA included a large proportion of products in the aircraft sector, and imports from Japan an above-average proportion of consumer electronics.

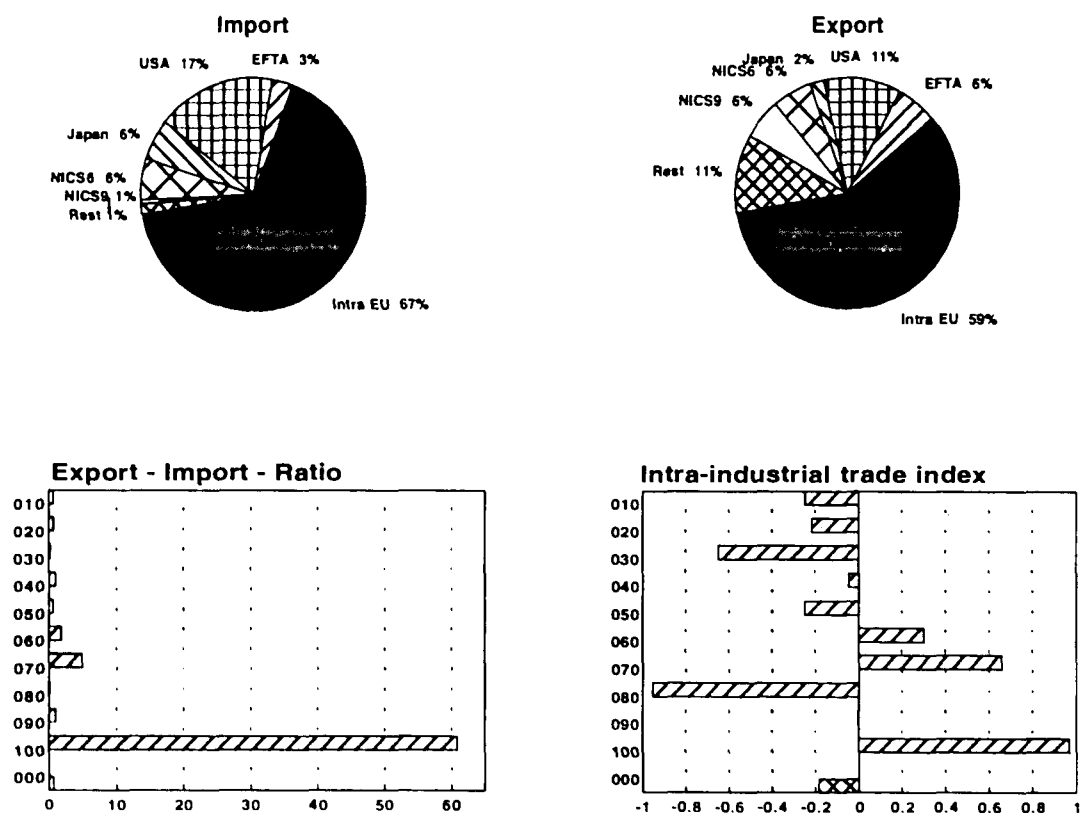

HTP exports from Switzerland reached ECU 3 billion in 1993 after steadily rising, but the country remained a net importer. As in the case of imports, the main partner for exports was the EU (59%). Other important markets were in the USA (11%) and in EFTA and the NICs 6 and NICs 9 group, with just under 6% each.

The product structure of Switzerland's HTP exports was very different from that of all the other countries discussed so far. With 25% to 30%, high-tech machinery was the most important product, followed by electronic components and scientific instruments

Fig.34

Country data for foreign trade in HTP Switzerland 1993

Shares of partner countries

Specialisation index (EFTA-related: see text)

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A. 4.4 in annex.

with just under 20% each and computers with just under 15%. The structure of exports to EU countries was similar to that of total exports, while electronic components predominated in exports to EFTA countries. Exports to the USA mainly comprised machinery and products for the aircraft and spacecraft sector. Machinery was also an important component in exports to Japan and the NICs 9 group.

The fact that Switzerland managed to achieve substantial export surpluses in three areas, i.e. scientific instruments, machinery and, to a small extent, weapons, does not alter the fact that in the other sectors and overall imports the surpluses were high. However, they were relatively low in the case of electronic components and the trend was downwards in the case of chemical products.

Switzerland's export-import quotients were very high in all directions, particularly for machinery, while they were substantially lower in the case of scientific instruments but still over 1.0, except in the case of trade with the United States. Total HTP trade showed a particular deficit in the case of trade with the United States and Japan. In trade in weapons, the difference between imports and exports was particularly great, resulting in extreme values.

Switzerland's degree of specialisation in foreign trade was below average in the case of imports but above average in the case of exports. On the imports side, there were low values for the aircraft and spacecraft sector, but above-average indices for consumer electronics, scientific instruments and chemical products. On the exports side, the above-average indices were for scientific instruments, chemicals and above all machinery.

Intra-industrial trade was very much in balance with the EFTA partners, the result deteriorating slightly only in 1993. Intra-industrial trade intensity was not on the same scale with the EU and was particularly low with the United States and Japan throughout the reference period.

Norway

After a few years of fluctuation, Norway's imports of high-tech products totalled ECU 1.8 billion in 1993, 38% of which came from the EU and 9% from other EFTA countries. With 32% from the United States, 10% from Japan and 9% from the NICs 6 group, Norway's HTP imports were predominantly from overseas (Fig. 35).

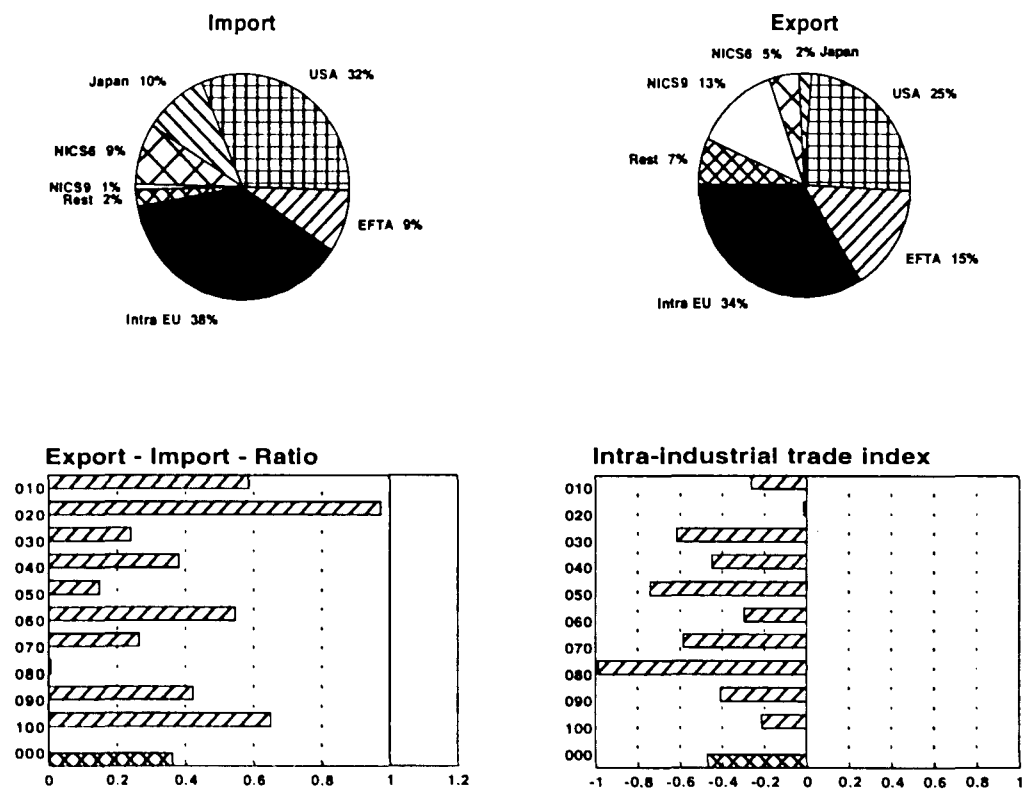

The main import items were computers and office equipment, with well over 40% on average during the entire reference period, and aircraft and spacecraft products, with over 20% most of the time. The leading products imported from the EU were computers with an average of 50%, while aircraft products predominated in the case of imports from the USA, except in 1993. Other product groups accounted for a maximum of 10% of Norway's imports.

Fig.35

Country data for foreign trade in HTP: Norway

1993

Shares of partner countries

Specialisation index (EU-related: see text)

Source: Eurostat; ifo Institute; Tables A 1.2 M and X, A 4.2, A 4.3
M and X, A. 4.4 in annex.

The level of Norway's HTP exports was far below that of its imports, at ECU 641 million in 1993 - slightly more than in the previous two years. As with imports, a relatively small proportion of exports (34%) went to the EU. 15% went to partners in EFTA, 25% to the United States and 13% to the NICs 9 group.

The main export items were the same as on the import side - i.e. computers with a little over 40% (but declining), and aircraft and spacecraft with a good 20% on average over the reference period. Weapons accounted for a good tenth, while electronic components and telecommunications products accounted for a little over 10%. In most years, the most important products for exports to the United States were in the aircraft sector, which recently also became important exports to the NICs 9 group. Exports to the EU mainly comprised computers, which together with weapons were also the main items exported to EFTA partners.

The trade balance overall and in almost all the individual product groups showed fairly clear import surpluses. The exception was the telecommunications sector, where exports and imports were in balance.

Apart from the telecommunications sector, the export-import quotients were low in all other sectors, and lowest in the case of consumer electronics, where exports were only around one seventh of imports.

The degree of specialisation in Norway's foreign trade was about average on the imports side and far below average on the exports side. Products of above-average significance were aircraft and spacecraft, telecommunications products and consumer electronics on the imports side and weapons on the exports side.

Intra-industrial trade was out of balance with all partners and in deficit, except with the NICs 9 group. In other words, imports exceeded exports.

Iceland

In 1993, the level of Iceland's imports was so low, at ECU 55.5 million, that even the reduction compared with 1990 (ECU 147 million) and 1991 (ECU 86 million) cannot be interpreted as a trend, since individual major contracts were involved. No data are available for 1989. In 1993, Europe was not a very important trade partner, with the EU accounting for 37% and EFTA for 10%, whereas transatlantic and other overseas trade was very important, totalling 53% (United States 36%, Japan 8%, NICs 15 group 9%).

Of the ten product groups under consideration, two - nuclear energy and weapons - did not account for any imports whatsoever. Two further groups, machinery and chemicals, were also insignificant in all the years under consideration, with import values of less than ECU 0.5 million. Of the remaining product groups, three are worthy of mention. However, there were wide fluctuations from year to year which make it impossible to determine structures. In 1992 and 1993, the most important group was computers, followed by consumer electronics and aircraft. In 1990 and 1992, on the other hand, aircraft and spacecraft were the leaders. This can be explained by the development in import values: there were imports of aircraft in 1990 and 1991 but none thereafter.

Iceland's exports of HTP products do not lend themselves to economic analysis, since they totalled ECU 9.5 million in 1990 and over 90% of them were air transport products delivered to the EU (transit, maintenance work?). The annual export value from 1991 to 1993 was a mere ECU 0.5 million, mainly accounted for by computers and consumer electronics (1992 and 1993).

In view of the scale of Iceland's foreign trade we have not examined or commented on indicators, nor have we included any graphics, since coincidence had a great part in determining the quotients and indices calculated (cf. Tables A 1.2 M and X, A 1.5 M and X and Table Group 4.1 to 4.4 in annex).

3.6 Summary

Rather than repeating the figures for the structure and development of the HTP foreign trade of the EU and EFTA Member States, we intend in this summary to demonstrate and depict the different emphases in the imports and exports of the individual Member States.

European Union

The Member States of the European Union (Fig. 36) can be divided into a number of groups depending on the emphasis they place on imports or exports. First there are countries such as Portugal, Denmark, Spain, Belgium/Luxembourg, Greece, Italy and France, which import over half their high-tech products from other EU Member States, plus in most cases 30-35% from overseas (USA, Japan, the NICs groups). With the remaining EU Member States, less than half of total imports come from the EU and slightly to considerably more than half from overseas. In all cases EFTA is a relatively unimportant partner. Denmark has the highest proportion of imports from EFTA, at 7%, presumably because of its proximity to the Scandinavian EFTA states.

Denmark's Scandinavian bias is particularly apparent in the case of its exports, 28% of which go to EFTA. The various countries fall into similar groups as regards export patterns. All the EU Member States concentrate on the EU market, which accounts for over 50% of total exports, with the exception of France, which has a large proportion of unspecified exports, and Denmark and Greece, which export large quantities to the former state-trading countries. The proportion of exports to overseas countries is generally fairly substantially less than 30%, probably because the competitive position of the EU Member States on the HTP markets is not particularly strong vis-à-vis these countries. The EFTA countries are somewhat more significant as importers than as suppliers of goods but, with the exception of Denmark as described above, account for hardly more than 10% of total exports.

Fig.36

Import and export patterns, EU Member States, 1993

Source: Eurostat, ifo Institute, Tables A 1.2M and X in annex.

European Free Trade Association

The large-scale intra-Community trade in the European Union does not have a counterpart in EFTA (Fig. 37). Here too, however, the same phenomenon can be observed as in the EU - imports account for less intra-EFTA trade than exports. In addition, the regional structure of trade by Austria and Switzerland - the countries which lie within the EU - is different from that of the Scandinavian countries, which lie on the periphery of the EU. Sweden, Finland, Norway and Iceland show relatively high EFTA exports, with the import levels somewhat lower but nevertheless higher than those of Austria and Switzerland. The opposite is true of imports from overseas, which account for over 50% in the Scandinavian countries, slightly less than 50% in the case of Austria and only 29% in the case of Switzerland. EFTA's overseas exports do not exhibit structures of this kind, except in the case of Norway and Ireland, where the geographic situation inevitably results in a certain emphasis on non-European trade.

1.1	Total import and export of hightech products	ECU mill., shares, rates of change
1.2	Import and export	ECU mill.
1.3	Trend in import and export	1989 = 100
1.4	Rates of change in import and export	Rates of change
1.5	Structure of import and export	Share of the various groups in total HTP
1.6	Significance of external trade in HTP	Share of HTP groups in industrial and total products
2. External trade by individual HT products and groups in the following sectors:		
2.1	Aircraft and spacecraft	in each Table:
2.2	Telecommunications	Import and export
2.3	Computers, office machines	ECU mill.
2.4	Electronics	Rates of change
2.5	Consumer electronics	Shares in total
2.6	Scientific instruments	
2.7	Machinery	
2.8	Nuclear power	
2.9	Chemicals	
2.10	Weapons	
3. Classification of product groups by technological level (highest, medium, lower high-tech)		
3.1	Import and export	ECU mill.
3.2	Trend in import and export	1989 = 100
3.3	Structure by individual trading partner and product group	%
3.4	Structure of product groups	%
4. Indicators		
4.1	Trade balance	ECU mill.
4.2	Export-import quotient	Quotient
4.3	Degree of import/export specialisation	Quotient
4.4	Intra-industrial trade index	Quotient
5. Country and product summaries		

Product groups:

HIT 010	Aircraft and spacecraft
HIT 020	Telecommunications
HIT 030	Office equipment- and computers
HIT 040	Electronic components
HIT 050	Consumer electronics
HIT 060	Scientific instruments
HIT 070	Mechanical engineering
HIT 080	Nuclear energy
HIT 90	Chemicals
HIT 100	Weapons
HIT 000	Total high-tech products

Symbols used in Tables

Since the raw data are supplied in ECU 1 000, in other words rounded, it was not possible to make a distinction between "not available" and "value below rounding threshold".

0= not available/ value below rounding threshold; figures may appear in calculations (changes, shares etc.).

* = No data available, calculation impossible or meaningless.

** = Calculated value 1 000 or over.

*** = Both import and export values are zero.

Certain tables were omitted in the case of Iceland (1.3 to 1.5, 4.1, 4.2 and 4.4) as the calculations for these tables did not produce any meaningful results. Tables 1.1 and 1.2 contain the basic data for Iceland.

1. Each table is marked M = imports or X = exports.

2. Each table shows external trade in high-tech products from the point of view of a given reference country or region (indicated in each case). The tables in groups 1 and 4 also contain data for the individual EU and EFTA countries.

Regional breakdown

D	Germany
F	France
B-L	Belgium-Luxembourg
NL	Netherlands
I	Italy
UK	United Kingdom
DK	Denmark
IRL	Ireland
E	Spain
P	Portugal
GR	Greece

Abbreviations for EFTA countries:

A	Austria
S	Sweden
SF	Finland
CH	Switzerland
N	Norway
ISL	Iceland

NICs6-group countries:

Malaysia, Thailand, Singapore, Hong Kong, Taiwan and South Korea.

NICs9-group countries:

Philippines, Indonesia, China, India, Israel, Turkey, Argentina, Brazil and Mexico.

Class 1A countries:

Canada, South Africa, Australia, New Zealand, former Yugoslavia and Europe excluding the EU, EFTA and the statetrading countries.

List of individual products in the ten product groups
(Product No according to the Harmonised System - HS Code)

**Techno.
level ¹⁾**

Aerospace (HIT 010)

- A Turbo-jets =
- A Turbo-jets =
- B Turbo-propellers=LkW (841121)
- B Turbo-propellers1100KW (841122)
- C Parts of turbo-jets or turbo propellers (841191)
- A Reaction engines other than turbo-jets (841210)
- B Helicopters=0 kg (unladen weight) (880211)
- A Helicopters2000Kg (unladen weight) (880212)
- B Airplanes = 2000Kg (unladen weight) (880220)
- A Airplanes 2000-15000 Kg (unladen weight) (880230)
- A Airplanes 15000 Kg (unladen weight) (880240)
- A Spacecraft, satellites, etc. (880250)
- C Propellers, rotors, parts thereof (880310)
- A Ground flying trainers, parts thereof (880520)
- A Instruments a. appliances for aeronautical or space navigation (901420)

Telecommunication (HIT 020)

- B Telephonic or telegraphic switching apparatus (851730)
- B Apparatus for carrier-current line systems (851740)
- B Telegraphic apparatus (851782)
- B Optical fibre cables for telecommunication and data transmission (854470)
- B Apparatus for checking electrical quantities, for telecommunication (903040)

Computers, office machines (HIT 030)

- B Word-processing machines; automatic typewriters (846910)
- A Analogue or hybrid computers (847110)
- A PCs (847120)
- A Processing units (847191)
- B Input or output units (847192)
- B Storage units (847193)
- C Other computer units (847199)
- C Parts of computers and computer units (847330)
- C Photocopying apparatus with optical system, electrostatic, ind. proc. (900912)
- C Photocopying apparatus with optical system, other than electrostatic (900921)

1) A = Highest, B = medium, C = lower

Electronics (HIT 040)

- B LCD and LED indicator panels (853120)
- C Fixed capacitors, tantalum (853221)
- C Fixed capacitors, aluminium electrolytic (853222)
- C Fixed capacitors, ceramic dielectric, single layer (853223)
- B Fixed capacitors, ceramic dielectric, multilayer (853224)
- C Printed circuits (8534)
- C Boards, panels, etc.=V (853710)
- C Other microwave tubes than magnetrons a. klystrons (e.g. carcinotrons) (854049)
- C Other valves and tubes of heading 8540 (e.g. display tubes) (854089)
- C Diodes (854110)
- C Transistors (854121)
- C Transistors (854129)
- C Thyristors, diacs, triacs (854130)
- B Photosensitive semiconductors (854140)
- C Other semiconductors (854150)
- C Mounted piezo-electric crystals (854160)
- C Parts of semiconductors (854190)
- A Electronic integrated circuits and microassemblies (8542)
- C Signal generators (854320)
- C X-ray tubes (902230)
- C Automatic regulating apparatus (903289)

Consumer electronics (HIT 050)

- B Sound reproducing apparatus, other than cas.-type (e.g. CD-players) (851999)
- B Video recording or reproducing app., not magn. tape (harddiscs or CD) (852190)
- C Other recorded media (e.g. CDs, CD-ROMs) (852490)
- B Television cameras (including camcorders) (852530)

Scientific, medical, optical apparatus: prostheses (HIT 060)

- A Particle accelerators (854310)
- C Optical fibres and cables, not f. telecommunication or data transmiss. (900110)
- C Monoculars, telescopes, astronomical instruments (900580)
- A Other than optical microscopes (901210)
- B Parts and accessories of 901210 (901290)
- C Lasers (901320)
- C Other optical instruments of chapter 90 (e.g. LCDs) (901380)
- B Electro-cardiographs (901811)
- A Electro-diagnostic apparatus (other than electro-cardiographs) (901819)
- C Artificial joints (902111)
- C Artificial parts of the body (other than artif. joints, artif. teeth) (902130)
- C Hearing aids (902140)
- C Pacemakers (902150)
- C X-ray apparatus for medical use (902211)

- C X-ray apparatus for other use (902219)
- C Alpha, beta gamma ray apparatus for medical use (902221)
- C Alpha, beta gamma ray apparatus for other than medical use (902229)
- C Other products of 9022 (e.g. app. with betatron, x-ray screens, parts) (902290)
- C Spectrometers, spectrophotometers, spectrographs (902730)
- B Apparatus using optical radiations (902750)
- B Apparatus for measuring ionizing radiations (903010)
- B Cathode-ray oscilloscopes and oscillographs (903020)

Machinery (HIT 070)

- C Gas-turbines=êKW (841181)
- C Gas-turbines5000KW (841182)
- C Parts of gas turbines (841199)
- B Machine-tools, operated by laser, ultrasonic proc., electro-discharge (8456)
- B Multi-function transfer machines (845710)
- C Flat-surface grinding machines, accuracy 0,01 mm, numeric. controlled (846011)
- C Other grinding machines, accuracy 0,01 mm, numerically controlled (9846021)
- C Sharpening machines, numerically controlled (846031)
- C Honing or lapping machines (846040)
- C Automatic machines for resistance welding (851521)
- C Automatic machines arc welding (851531)

Nuclear power; radioactive elements and isotopes (HIT 080)

- C Natural uranium (284410)
- A Enriched uranium, plutonium (284420)
- A Depleted uranium, thorium (284430)
- C Spent fuel elements of nuclear reactors (284450)
- A Heavy water (deuterium oxide) (284510)
- A Nuclear reactors (840110)
- A Apparatus for isotopic separation (840120)

Machinery (HIT 070)

- C Gas-turbines=êKW (841181)
- C Gas-turbines5000KW (841182)
- C Parts of gas turbines (841199)
- C Automatic machines for resistance welding (851521)
- C Automatic machines arc welding (851531)

Nuclear power; radioactive elements and isotopes (HIT 080)

- C Natural uranium (284410)
- A Enriched uranium, plutonium (284420)
- A Depleted uranium, thorium (284430)
- C Spent fuel elements of nuclear reactors (284450)
- A Heavy water (deuterium oxide) (284510)
- A Nuclear reactors (840110)
- A Apparatus for isotopic separation (840120)

B Fuel elements, non-irradiated (840130)

C Parts of nuclear reactors (840140)

Chemicals (HIT 090)

C Pure silicon (280461)

C Selenium (280490)

C Rare-earth metals, scandium, yttrium (280530)

C Germanium oxides, zirconium dioxide (282560)

B Radioactive elements and isotopes (other than uranium, thorium, plut.) (284440)

C Non-radioactive isotopes (other than heavy water) (284590)

C Compounds of rare-earth metals, of yttrium, of scandium (2846)

B Hormones (2937)

C Polyethylene terephthalate (390760)

Weapons (HIT100)

B Tanks and other armoured fighting vehicles (8710)

B Military weapons (9301)

B Bombs, grenades, torpedos, mines, missiles, and similar munitions (930690)

High-Tech Products Total (HIT 000)

1.1 M Total imports of high-tech products by main trading partner
Reference region EU

The internal market, the European Economic Area and the Treaty on European Union are important milestones on the road to European union. Against the current background of rapid change, *EUR-OP News* is a source of information on all the relevant developments at European level and offers you an overview of the whole range of information available on the current policies of all the European institutions.

Four times a year you can receive a general overview of all the important areas of European policy such as:

- EU institutions
- Internal market
- Economy
- Foreign policy
- EU law
- Central and Eastern Europe
- Regional policy
- Environmental policy
- Social affairs
- Research and education

EUR-OP News is intended not only for specialists and experts but also for teachers and students and anyone who simply wishes to keep abreast of European affairs.

EUR-OP News also contains information on new publications by EUR-OP, the publishing house of all the EU institutions (Council, Commission, European Parliament, etc.), so that you can obtain literature for further study of all the topics covered.

European Commission

External trade in high-tech products

Luxembourg: Office for Official Publications of the European Communities

1996 — 736 pp. — 21.0 x 29.7 cm

Theme 6: External trade (red)

Series D: Studies and research

ISBN 92-827-4993-2

Price (excluding VAT) in Luxembourg: ECU 16

This is a study of the evolving competitiveness of European high-tech products and industries. It is based on the analysis of international trade between 1988 and 1992, with special emphasis on the EU's major trading partners (EFTA, USA, Japan).
