1. INTRODUCTION

1.1. General comments

This report forms part of a series of yearly reports providing regularly updated information on trends in the government financing of R&D in Member States of the Community.

The Community survey designed to gather data on government financing of research and development takes into account only the budget appropriations entered in the budgets of the Member States for R&D, and not the budget appropriations actually spent.

The corresponding amounts are subdivided into final appropriations, voted by the competent authorities, for the years prior to the survey year and provisional appropriations, subject to revision, for the current year.

In addition, the data on government financing of R&D are classified by socio-economic objectives according to the 1983 version of the NABS nomenclature (Nomenclature for the analysis and comparison of science programmes and budgets).

The most important information on the collection, processing and interpretation of basic data is given below (and in the annexes). Further details are given in a handbook drawn up by the Subcommittee.¹

1.1.1. The field of the survey remains the same as in previous reports. It covers the financing of R&D by central government as defined in the European system of integrated economic accounts (ESA). This definition includes within central government the *Länder* of the Federal Republic of Germany, but excludes other regional expenditure and expenditure by public enterprises, for which only budget financing is taken into account in the R&D budget. An analysis of Community-financed R&D is also included.

1.1.2. Unlike the previous reports, this report takes 1980 as the reference year. This is the reference year most commonly used for Community statistics in general and national accounts in particular to calculate amounts in real terms. The analysis of time series will be confined to a period starting in 1981 because of the major breaks in the series between 1980 and 1981.

1.1.3. This report gives data available in 1986 on final budgets for 1985 and provisional budgets for 1986 together with various time series going back to 1980. The basic data are given in terms of current prices, and at current exchange rates,² but the most important tables are those which give an idea of the trends, in real terms, in R&D financing. In these tables (Table I, Section 2, and Table 3 in the statistical annex),³ the overall totals have been deflated by a price index specific to R&D based on data taken from national accounts for years prior to 1986 and from estimates for 1986 projected from earlier data.

1.1.4. In the body of the report, an attempt has been made to distinguish clearly between the retrospective analysis of the trends from 1980 to 1985, based on actual R&D appropriations taken from final budgets, and the comparison of provisional figures for 1985 and 1986, based on data from provisional budgets, likely to be substantially revised during the year.

¹ See 'Methods and definitions used for the annual report on government financing of R&D' (Crest/1217/81). This document can be obtained from the Subcommittee's secretariat.

² For implementation of this principle, see Annex 2.

³ Generally, the tables in the text are numbered in roman numerals and those in the statistical annex in arabic numerals.

1.1.5. At the end of the report there is also a specific analysis of government R&D funds for enterprises (Section 5) and for multilateral cooperation (Section 6). There is also a provisional quantitative evaluation of the budget appropriations for R&D in fields not explicitly mentioned in the 1983 NABS nomenclature, but which have been singled out for analysis because of their growing interest; these are biotechnology, information technology and developing countries (Section 8).

1.2. General characteristics of total and government financing of R&D

To obtain a better picture of the importance of government funds in total R&D expenditure, it is useful to make a comparison both between the Member States and between the Community of 12 and the OECD countries with a major research effort (United States, Japan). For this purpose the data used throughout paragraph 1.2 will be OECD data taken from biennial surveys on overall R&D spending by OECD member countries, converted into ECU.

Although they relate to the same definitions of R&D, OECD and Community data differ nevertheless on certain points:

- (i) The data obtained from ISY (International Statistics Year) surveys reflect actual expenditure within national territory established after the event and are compiled by the research establishments themselves.
- (ii) Community data, taken from national budgets, relate to the proposed government funding (i.e. are compiled in advance of spending) for research carried out within and outside national territory and are supplied by those putting up the research funds.

These differences are reflected in the concepts used by the two organizations, particularly the concept of government financing, but a structural analysis of the OECD data nevertheless provides interesting pointers for the Community countries. The most recent data available are for 1983 (or, failing that, are estimates based on earlier years).

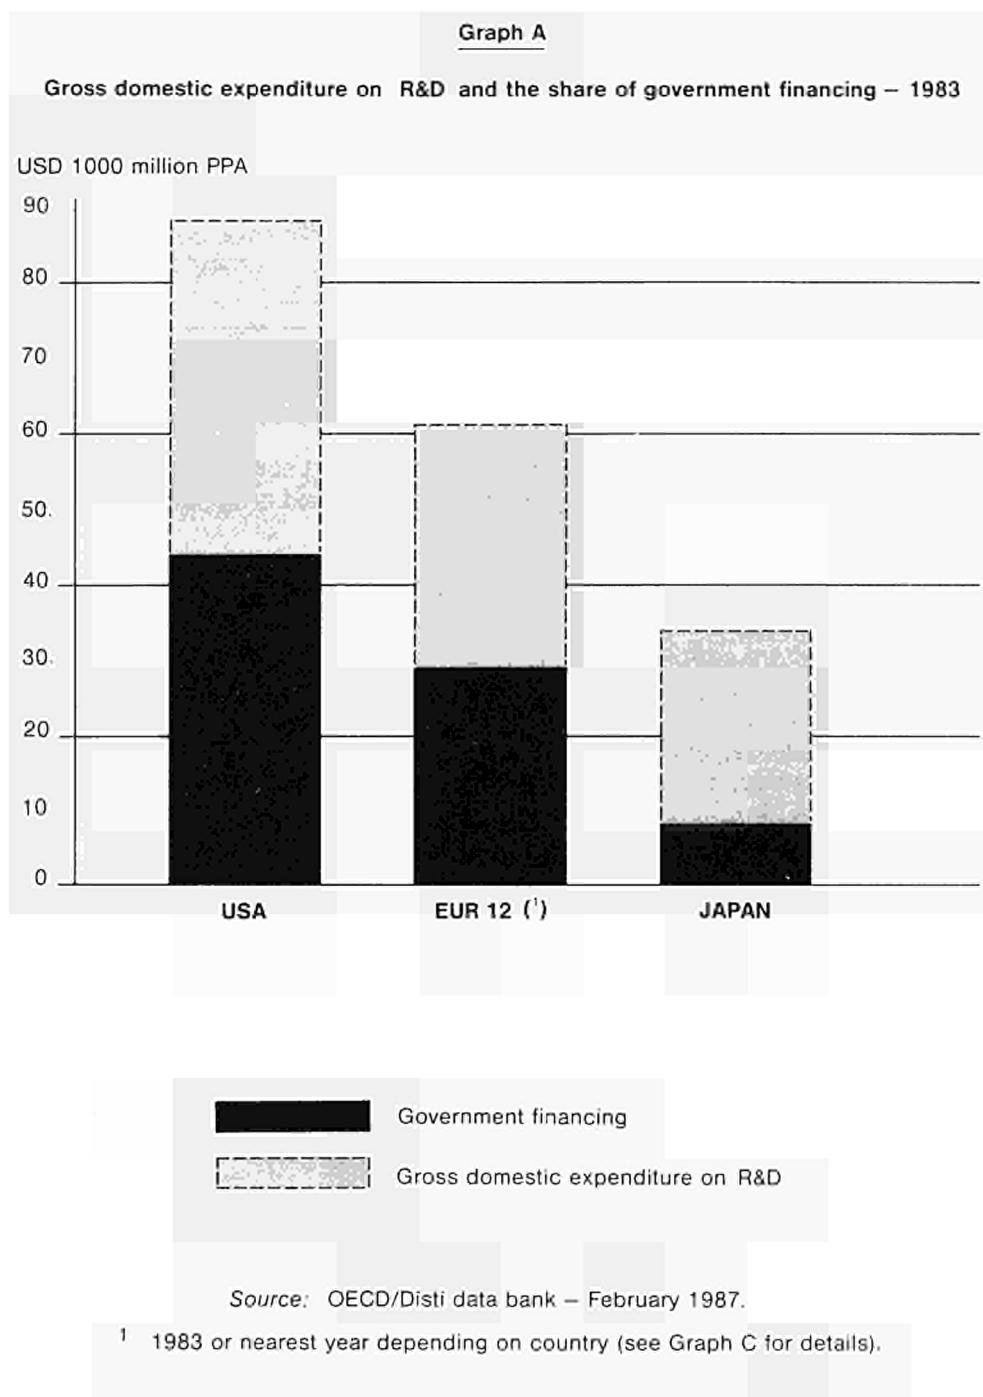

1.2.1. Gross domestic expenditure on R&D

Evaluated in terms of purchasing power parity in dollars so not to cut out distortions caused by exchange rate fluctuations, gross domestic expenditure on R&D in the United States and Japan was respectively 1.48 and 0.51 times the expenditure of all Community countries taken together.

However, defence research expenditure has a significant effect on these comparisons. Comparing gross domestic expenditure on civil R&D alone, the differences separating the United States from the Community and Japan are much smaller and similar levels of expenditure are found in the Community and the United States.

1.2.2. Gross domestic expenditure on R&D and government financing

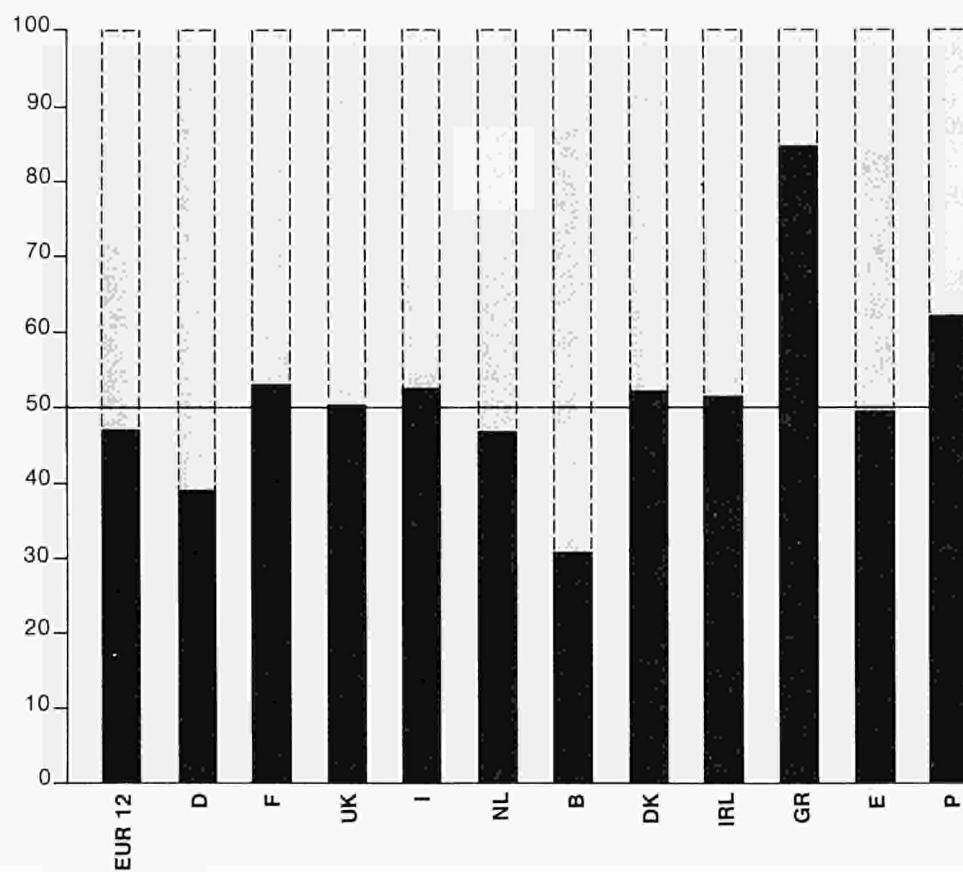

The breakdown of gross domestic expenditure on R&D between government and other sources is illustrated in the following graph:

The actual share of government financing in the total R & D expenditure of the Member States is shown in the graph below:

Graph B

Gross domestic expenditure on R&D and the share of government financing – 1983

 **Government financing**
 **Gross domestic expenditure on R&D**

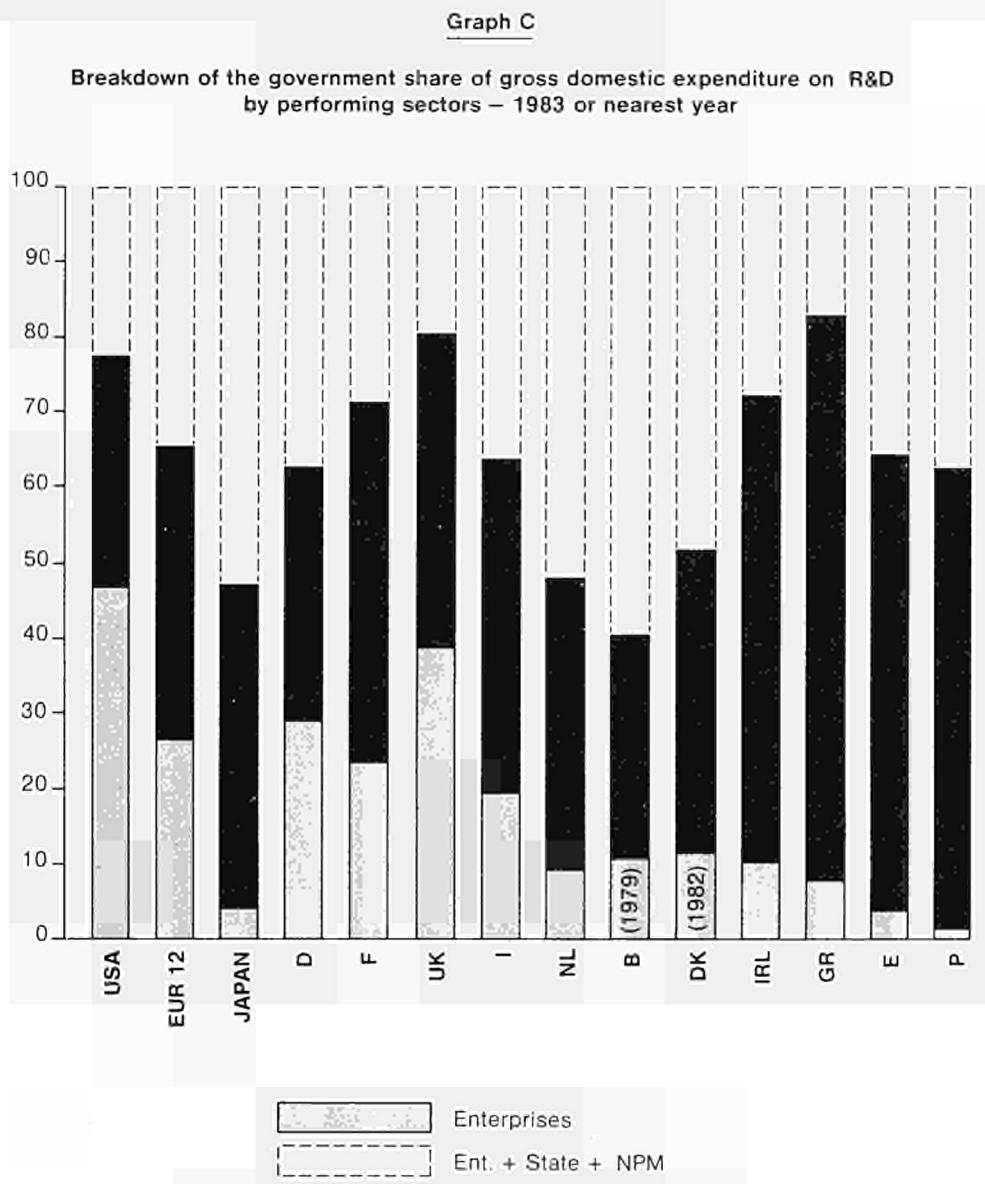

Source: OECD/Disti data bank – February 1987.

In two countries the share of government financing in gross domestic expenditure on R & D is well above the Community average of 47%: Greece (84%) and Portugal (62%).

In contrast, two countries are well below this average: FR of Germany (39%) and Belgium (31%).

1.2.3. Breakdown of government financing of gross domestic expenditure on R & D by performing sectors

If we now consider how government funding is actually distributed among the three main sectors carrying out research – industry, the public sector/non-profit-making institutions, and higher education – we find the situation illustrated in the following graph:

In the breakdown of government financing of gross domestic expenditure on R & D the Community occupies a position between the United States and Japan: The USA, EUR 12 and Japan assign respectively 47%, 26% and 5% of their public funding to enterprises and 23%, 32% and 52% to higher education.

One Member State, France, breaks down its government R & D funding on the lines of the Community average.

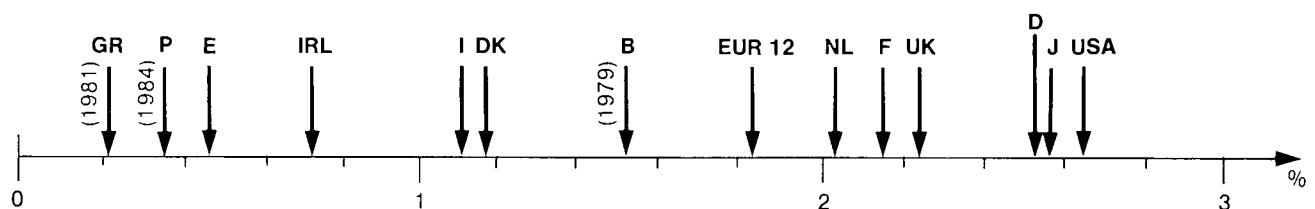

Among the other Member States, the United Kingdom is the country where the pattern is nearest to the American one, whereas the Netherlands, Belgium and Denmark have a breakdown more closely akin to that of Japan.

1.2.4. Ratio of gross domestic expenditure on R&D to gross domestic product

If gross domestic expenditure on R&D is related to gross domestic product to obtain some idea of the impact of research expenditure on the economy, the relative position of the various countries can be represented as follows:

Graph D

Ratio of gross domestic expenditure on R&D to gross domestic product – 1983 or nearest year

Source: OECD/Disti data bank – February 1987.

Among the Member States there was only one country in 1983 that had a ratio of gross domestic expenditure on R&D to gross domestic product well above the Community average of 1.82% and close to that of Japan (2.56%) and the United States (2.65%): this was Germany (2.54%).

Three other countries have a ratio above the Community average: United Kingdom (2.27%), France (2.15%) and the Netherlands (2.02%).

The other countries have a ratio well below the Community average.

2. Trends in budget appropriations for R&D

Before examining the trends in budget appropriations for R&D in the Community countries, we shall briefly survey the comparative trends, as regards total R&D expenditure and the share of government financing, between the Community and those non-Community countries of most interest for comparison purposes, the United States and Japan.

2.1. Comparative trends in the Community, the United States and Japan

Although we have comparable figures for all three on total gross domestic R&D expenditure, the same is not true of government spending.

The only figures currently available for R&D budget appropriations in Japan are partial estimates that do not go beyond 1984 for two essential reasons. Firstly, it is extremely difficult to single out the real share of research in the Japanese budget. Secondly, the estimates available apply to domestic research and disregard Japanese Government financing for research carried out abroad.

It therefore seemed preferable in the case of government R&D appropriations to make use of the much more reliable figures on government funding taken from the OECD surveys, the latest of which for Japan covers 1984.

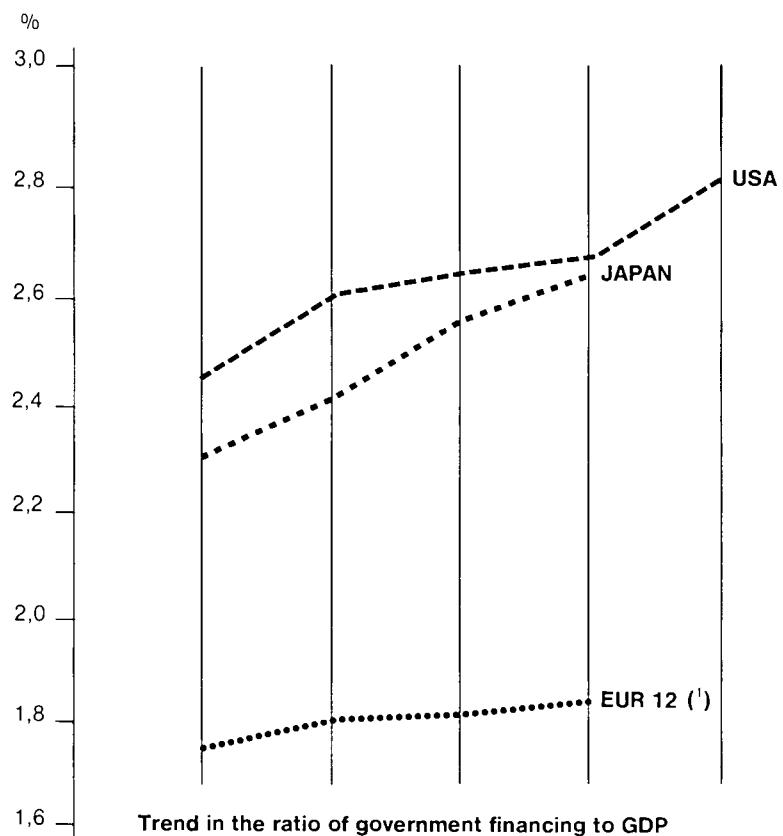

Finally, trends in gross domestic expenditure and government financing of R&D will be related to the gross domestic product so as to obtain a better understanding of the links between R&D and the general economy.

2.1.1. Comparative trends in the ratio of gross domestic R&D expenditure to GDP

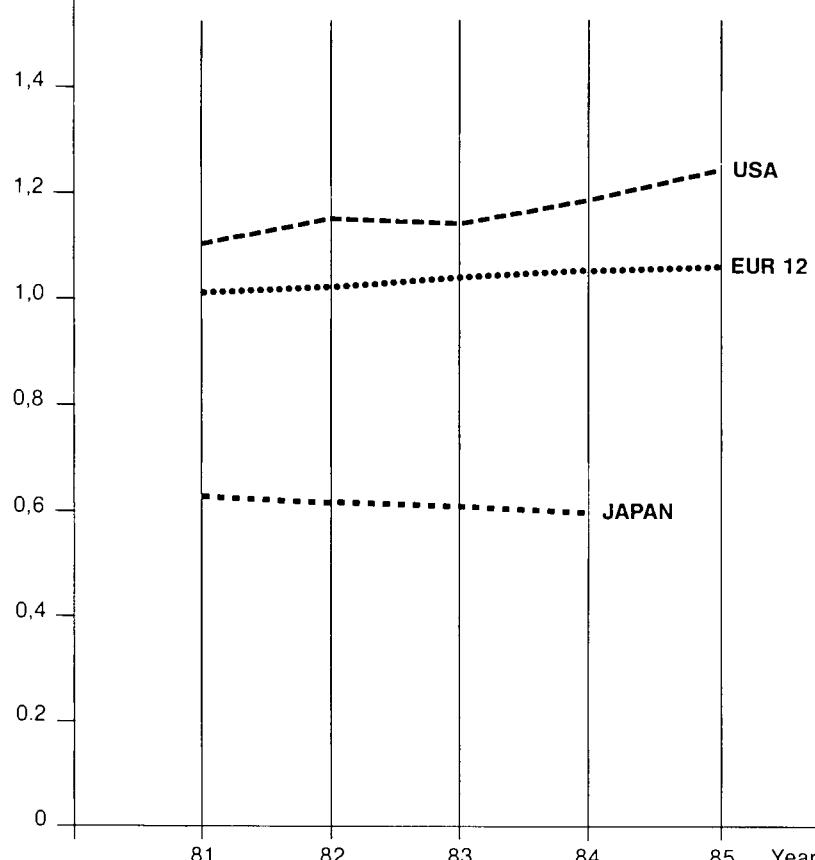

If we consider only the period 1980-84 for which data have been estimated for EUR 12, we find a steady increase in the ratio of gross domestic R&D expenditure to GDP which demonstrates the relationship between R&D and the economy (see Graph H). However, the growth rate differs for the three regions under consideration over the period 1981-84: the ratio increases by an average of 1.5% a year for the Community as a whole compared with 3% for the United States and 4.5% for Japan.

Graph E

Trend in the ratio of gross domestic R&D expenditure to GDP

Trend in the ratio of government financing to GDP

Source: OECD.

¹ Estimate.

2.1.2. Comparative trends in the ratio of government financing of R & D to gross domestic product

In contrast to the previous ratio, this ratio remained steady in Japan and showed a relatively modest increase for the Community as a whole and the United States over the period 1981-84 (see Graph F).

In the United States this modest increase is mainly due to the impact of defence appropriations. As the figures in Table 16.1 show, total budget appropriations recorded a far higher increase in 1981-84 than government appropriations for civil R & D, which even declined in real terms after deflation by the implicit index used to calculate the gross domestic product.

A predominance of one of the two types of appropriations cannot account for the small increase in the Community ratio. On average civil R & D appropriations increased at the same rate as total government appropriations over the period 1981-84 and this trend continued in 1985, as is shown by Table I, where the figures have been deflated by the R & D price index.

Nevertheless the ratio of gross domestic R & D expenditure to GDP rose only slightly faster than the ratio of government financing to GDP for the Community as a whole.

2.2. Trends in the breakdown of budget appropriations for R & D within the Community

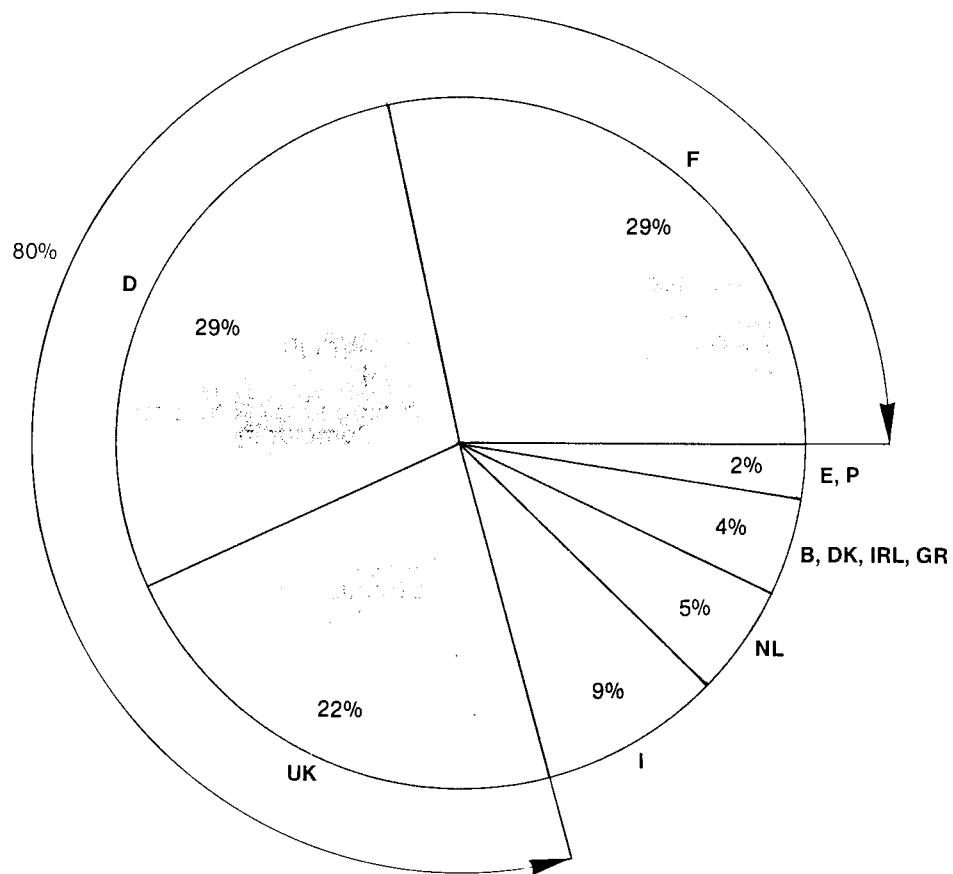

The figures in the following paragraphs relate solely to the Community and refer to budget appropriations for R & D as defined in the manual 'Methods and definitions' (see footnote 1, page 1).

Before examining the trends in government spending on R & D in EUR 12 as a whole and in the individual Member States, it might be useful to consider the relative importance of each country within the Community.

In order to rule out the incidence of any fluctuations in prices and exchange rates, figures deflated by the R & D price index and converted on the basis of 1980 exchange rates will be used. The choice of 1980 as the reference year for comparisons of R & D data may appear arbitrary but, as already mentioned, it is the year commonly taken for the preparation of all Community statistics, which include research figures. The breakdown of budget appropriations for R & D on that basis is shown below:

Graph F

**Breakdown of budget appropriations for R&D (at 1980 prices and exchange rates)
within the Community in 1985**

In 1985 the three large countries (Germany, France and the United Kingdom) together accounted for 80% of the total budget appropriations for R&D (in real terms) of the Community countries. That share has declined somewhat in comparison to 1981 (see Table I). This changing pattern is due to Germany's slower rate of increase than the Community average and the very marked increase in Italy's government R&D funding since 1981 (see Graph G).

2.3. Trends in R&D budget appropriations for the Community as a whole

2.3.1. Trends in total budget appropriations

In 1985 R&D budget appropriations for EUR 12 amounted to 34 500 million ECU, an increase of 2 800 million ECU or 8.8% over 1984. This growth in nominal terms is close to the average annual rate of increase over the period 1981-85, which was 9% (see Table 1 in the statistical annex). However, this average is distorted since it incorporates exchange rate fluctuations.

Evaluated in 1980 prices and exchange rates, total Community appropriations for R&D increased by 3.0% in 1985, slightly more than the average rise of 2.6% recorded over the period 1981-85. The growth in government R&D spending (expressed in real terms) is shown to be remarkably steady over this period.

A comparison of provisional budgets for 1985 and 1986 indicates that this growth in real terms is likely to continue at an annual average rate close to 2.2%.

2.3.2. Trends in budget appropriations for civil R&D

Although on average civil R&D appropriations (expressed in 1980 prices and exchange rates) have increased at a slightly higher rate than total R&D appropriations (see Table I), from 1982 to 1984 the growth rate for the former was consistently below that of the latter. Only in 1985 did civil R&D appropriations pick up to a growth rate similar to that of total appropriations and a comparison of provisional budgets indicates that they should record a similar rate in 1986.

2.3.3. Trends in the ratio of R&D budget appropriations to total budgets and to gross domestic product

The ratio of R&D budget appropriations to total budgets for EUR 12 may be estimated at slightly above 3% and has remained relatively steady over the years.

In contrast, the ratio of R&D budget appropriations to GDP, just above 1%, showed a steady upward trend over the whole period 1980-85 (see Graph H).

2.4. Trends in budget appropriations for R&D in the Community Member States

2.4.1. Trends in the total R&D budget appropriations of the Member States

The steady increase in total budget appropriations for R&D over the period 1981-85 for EUR 12 as a whole (see Graph G) naturally conceals very differing trends in the Member States. However, on the basis of growth rates in appropriations (expressed in 1980 prices and exchange rates) from 1984 to 1985, the countries can be divided into two groups on either side of the growth rate in R&D appropriations for the Community as a whole for the same year (3%):

- (i) of the countries with a growth rate above the Community average (Ireland (13%), Greece (9%), Denmark (7.4%), Italy (4.2%), Belgium (3.7%), Germany (4.3%)), the first three had a particularly high rate of increase;
- (ii) of the countries with a growth rate below the Community average (France (1.7%), United Kingdom (-0.6%) and the Netherlands (-1%)), two countries saw a decline in real terms in their government R&D spending.

It should be pointed out that apart from Italy, whose R&D budget appropriations have recorded the highest growth of all the Member States since 1981 (see Graph G), all the countries in the first group saw their R&D budget appropriations increase in 1985, in real terms, at a rate higher than the annual average for the period 1981-85 (see Table I).

In contrast, all the countries in the second group recorded in 1985 a growth in real terms below the Community average for the same period.

The outlook for 1986 which emerges from a comparison of provisional budgets is as follows:

- (i) five countries are likely to see the volume of their R&D budget appropriations, expressed in 1980 prices and exchange rates, increase faster than the Community average (2.2%): Ireland (16.8%), Italy (13%), France (5.2%), Netherlands (3.3%) and Denmark (3%).

Thus Italy would revert to the high growth rate observed since 1981 apart from the levelling-off in 1982 and lower growth in 1985, while Ireland would continue the increase that started in 1985;

- (ii) all the other countries are likely to drop below the Community average in real terms:

Germany (0%), Greece (-3.2%), United Kingdom (-4.2%), Belgium (-6.1%).

Of the countries whose budget appropriations are likely to remain more or less the same or decline, the United Kingdom figure would be down for the second year running.

2.4.2. Trends in budget appropriations for civil R&D in the Member States

As pointed out earlier, the growth in the volume of civil R&D appropriations did not run parallel to the increase in total research appropriations throughout the period 1980-85 but showed a downward trend in the years 1982 to 1984. This decline affected all the main countries involved in defence research (United Kingdom, France, Germany and even Italy).

It seems likely from a comparison of provisional budgets for 1985 and 1986 that the increase in civil R&D appropriations will pick up to a rate close to that of total appropriations. However, as Table I shows, this does not apply to the Federal Republic of Germany and Belgium where civil R&D appropriations may well even decline in real terms in 1986. The same seems probable for the United Kingdom and Greece but in those countries both civil and defence R&D appropriations will decline.

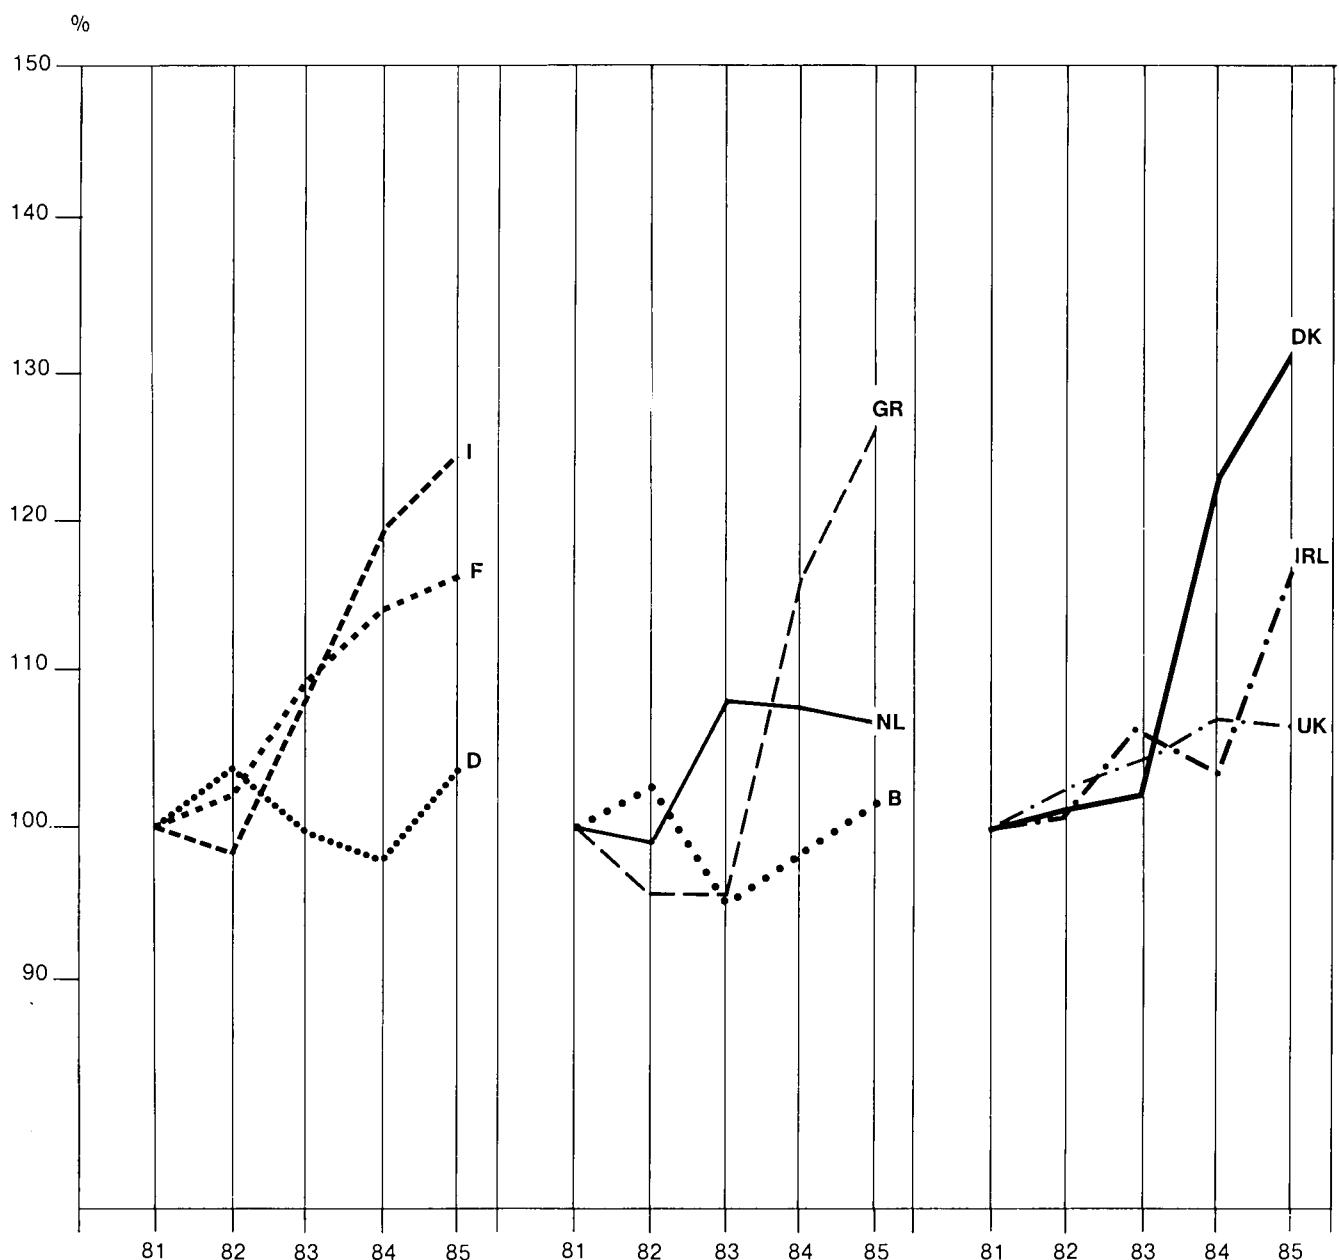

2.4.3. Trends in the ratio of R&D budget appropriations to total budgets and to gross domestic product

The relative stability in the ratio of R&D budget appropriations to total budgets estimated for EUR 12 over the whole of the period 1980-85 is found in most of the countries with the exception of France, whose ratio has steadily increased, and the Netherlands, where the ratio is tending to decline.

The upward trend for the Community as a whole in the ratio of R&D budget appropriations to gross domestic product is reflected mainly in France and Italy and, to a lesser extent, in Denmark and Greece. In the other countries the ratio has tended to hover around an average rate over the whole of the period 1980-85 (see Graph H).

¹ Comparison of provisional budgets.

² Estimate.

3. Changes in the structure of R&D budget appropriations by objectives

Because of the different share of R&D appropriations going to defence in the Community countries, a distinction will be made here between civil and defence R&D appropriations.

3.1. Changes in the structure of total R&D appropriations

Although the importance of defence in total government R&D financing differs greatly from one country to another, one feature is common to all of them: the largest single amount of their financing goes to objective 10 (Research financed from general university funds). For EUR 10, more than 21% of total government R&D funding in 1985 went to this type of research, with only defence accounting for a larger percentage.

Two countries spent approximately the Community average on research financed from general university funds: Italy (21.7 %) and Ireland (19.7 %). Most of the others allocated a higher percentage: the Netherlands (46%), Germany and Denmark (31%), Greece (28%). Only the United Kingdom and France fell below the Community average: United Kingdom (14.6%), France (11.9%). Although this is partly due to the importance of defence research in those countries, another factor, at least in France, is the predominance of 'non-oriented research' which accounts for almost 15% of total government R&D appropriations there.

The following table grouping related objectives has been drawn up to facilitate comparison:

Table II
EUR 10: Government R & D appropriations classified by groups of objectives

Groups of NABS objectives	Final budgets		Provisional budgets		%
	1984	1985	1985	1986	
2 – 3 – 4 – 8 Human and social objectives	9.6	9.4	9.7	9.5	
1 – 5 – 7 – 9 Technological objectives	27.8	28.1	26.9	27.8	
6 Agriculture	4.0	3.7	3.9	3.6	
10 Research financed from general university funds	21.6	21.2	21.2	22.1	
11 Non-oriented research	10.7	10.9	11.1	11.3	
12 Unclassified	0.8	0.9	1.0	0.8	
13 Defence	25.5	25.8	26.2	24.9	
Total	100.0	100.0	100.0	100.0	

There is no sign of any major structural changes between 1984 and 1985 for the Community of Ten. Only research financed from general university funds, agriculture and social and human objectives show a slight decline in their share in total government appropriations for R & D.

For objectives 10 and 6 this decline affects virtually all countries apart from Italy and Greece. The main reason for the reduction in the share of social and human objectives in 1985 is the reclassification of NABS objectives carried out by France in 1984, principally affecting objective 8 'social structures and relationships' (see Section 4.2).

In contrast the very small increase in the share of objective 11 'non-oriented research', again for the Community of Ten, is mainly due to the Italian figure which is up from 5.7% in 1984 to 7.6% in 1985.

The small rise in the share of technological objectives stems from movements in different directions in the Member States, with substantial increases in Ireland (25.6% in 1984, 32.7% in 1985) and Denmark (27.6% in 1984, 32% in 1985).

3.2. Changes in the structure of civil R&D spending

Overall government financing of civil R&D accounts for approximately three quarters of the total Community research budget but the percentage varies greatly from one country to another: Ireland (100%); the Netherlands, Belgium, Denmark, Greece (over 95%); Germany, Italy (around 90%); France (69%); United Kingdom (48%).

The breakdown of the appropriations is as follows for the Community as a whole:

Table III
EUR 10: Government appropriations for civil R&D classified by objectives

NABS objectives	Final budgets		Provisional budgets		%
	1984	1985	1985	1986	
1. Exploration and exploitation of the earth	2.2	2.3	2.3	2.2	
2. Infrastructure and general land-use planning	3.1	2.9	2.9	2.9	
3. Control of environmental pollution	2.1	2.2	2.2	2.1	
4. Protection and improvement of human health	5.4	4.8	5.2	4.7	
5. Production, distribution and rational utilization of energy	14.4	12.9	13.2	11.5	
6. Agricultural productivity and technology	5.4	5.0	5.3	4.8	
7. Industrial productivity and technology	15.2	16.9	15.3	17.2	
8. Social structures and relationships	2.3	2.8	2.8	3.0	
9. Exploration and exploitation of space	5.6	5.7	5.7	6.1	
10. Research financed from general university funds	29.0	28.6	28.7	29.4	
11. Non-oriented research	14.3	14.7	15.1	15.1	
12. Other civil research	1.0	1.2	1.3	1.0	
Total civil R&D financing	100.0	100.0	100.0	100.0	

Leaving aside Chapters 10 and 11, examined earlier, and Chapter 13, discussed below, technological objectives show the widest variations, and in particular appropriations for energy and industry.

The share of government R&D financing going to energy has shrunk in all the Member States except Greece and, to a lesser extent, Denmark. This is particularly marked in Italy (22.7% in 1984, 19.7% in 1985), although it remains the Community country devoting the highest proportion of its research spending to energy.

In contrast, spending on industrial research is up everywhere except in the United Kingdom and Belgium. The increase in the share of industrial research appropriations is particularly high in Ireland (21.6% in 1984, 28.9% in 1985) and Denmark (16.6% in 1984, 21% in 1985), both of which recorded a large increase in total budget appropriations for R&D in 1985. In Ireland, this high increase followed a law take-up of R&D grants by industry in 1984, compared to the provisional appropriations for that year.

3.3. Changes in the structure of defence spending

In 1985 military research accounted for one quarter of R&D budget appropriations in the Community as a whole and was concentrated mainly in four countries:

Table IV
Defence as a percentage of total government financing for R & D

	Final budgets		Provisional budgets	
	1984	1985	1985	1986
United Kingdom	50.4	51.9	51.7	51.6
France	33.4	31.3	31.3	31.0
Federal Republic of Germany	10.0	11.9	12.0	12.4
Italy	8.3	9.9	11.0	8.4
EUR 12 ¹	25.4	25.3	25.6	24.5

¹ Estimate.

The share of defence increased in all these Member States except France where the decline was due to the 1984 extension of the basis for the evaluation of defence R&D (see Section 4.2).

4. Special features of government R & D financing in each Member State

4.1. Federal Republic of Germany

4.1.1. General trends in R & D expenditure

According to the final budgets of the Federal and *Land* governments, R & D expenditure financed by the public sector in Germany amounted to DM 21 000 million in 1985, a nominal increase of 8.3% over 1984 (DM 19 400 million). With a 2.5% rise in the R & D price index, this is equivalent to a real increase of over 5%.

R & D spending for 1986 entered in the provisional budgets of the Federal and *Land* governments (to some extent supplemented by estimates) totals DM 21 400 million, 2.5% up on the comparable figures for 1985, so that a slight real increase can also be expected.

3.2	2.2	16.4	17.8	7.6	6.3	-	19.4	-	-	14.1	14.7	0.8	1.3	11. Non-oriented research
-	-	-	-	0.7	2.1	-	2.2	-	-	1.0	1.2	-	-	12. Other research
100.0	100.0	100.0	100.0	100.0	100.0	-	100.0	-	-	100.0	100.0	100.0	100.0	Total financing of civil R&D

From the evolution in R & D expenditure on the groups of NABS objectives (see Table VIII-1) it can be seen that, between 1984 and 1985, all groups with the exception of non-oriented research experienced a proportionate decline to the advantage of defence research, and this decline was greatest in the proportion allocated from research financed from general university funds. According to the data in the 1986 provisional budget, however, the share of this research objective may increase again, and this also applies, albeit less clearly, to the human and social objectives. In the case of the non-oriented research objectives and in that of defence, these data also indicate a proportionate improvement over the comparable 1985 values, whereas the technological objectives suffer a decline in their share of the overall R & D expenditure financed by the public sector.

Table VIII-1
Breakdown of government R & D appropriations by groups of objectives

Groups of objectives (NABS 1983)	Final budgets		Provisional budgets		%
	1984	1985	1985	1986	
2 – 3 – 4 – 8 Human and social objectives	10.8	10.4	10.4	10.5	
1 – 5 – 7 – 9 Technological objectives	33.1	32.8	32.8	31.4	
6 Agriculture	2.1	2.0	2.0	2.0	
10 Research financed from general university funds	32.6	31.4	31.2	31.8	
11 Non-oriented research	11.4	11.4	11.5	11.8	
13 Defence	10.0	11.9	12.0	12.4	
Total	100.0	100.0	100.0	100.0	

A decline in the human and social objectives was due mainly to the decrease in R & D expenditure in Chapter 2 (infrastructure and general planning of land use), all other chapters showing at least some increase. The situation as regards the technological objectives is similar: both the decline which occurred between 1984 and 1985 according to the data in the final budget and that to be expected according to the provisional 1986 budget stem mainly from the reduced expenditure in Chapter 5 (production, distribution and rational use of energy).

Referred to the groups of research objectives, the lion's share of government-financed R & D expenditure still goes to technological research and research financed from general university funds, which together account for about 63.2% of the resources, according to the provisional 1986 budget.

4.1.2. *R&D expenditure under chapter headings*

The trend in expenditure under the individual chapters is as follows:

Chapter 1

The funds allocated in the final budget to exploration and exploitation of the earth increased at an above-average rate (+ 14.7%) between 1984 and 1985. There were increases in expenditure on general research (heading 1.0) and climatology (heading 1.6). The most important headings in this chapter are headings 1.0 and 1.5.

Chapter 2

The data in the final budget show a 7% decrease in funds for 1985 as compared with 1984, and a further – though lesser – decrease is to be expected for 1986. Expenditure on the further development of town planning (heading 2.1) is affected by severe cut-backs, as are land transport and traffic (heading 2.4). As before, the main emphasis in this chapter is placed on R&D expenditure on traffic systems.

Chapter 3

Expenditure on research and development relating to the control and prevention of environmental pollution shows an increase well above average both in the final 1985 budget as compared with 1984 (+ 14.4%) and in the provisional 1986 budget as compared with 1985 (+6.8%). The increases in expenditure, which are financed by the Federal Government and by the *Länder*, are spread over all headings in the chapter; however, the greatest increase occurs in the field of ecological research under heading 3.0, on which the main emphasis in this chapter is placed.

Chapter 4

According to final 1985 figures, R&D expenditure on the protection and promotion of human health increased only at a below-average rate as compared with 1984; a slight decline in such expenditure is to be expected for 1986. This development is due mainly to a marked decrease in expenditure under heading 4.8, while the other headings in this chapter show only increases. The main emphasis in this chapter is placed on headings 4.1 and 4.0.

Chapter 5

Comparison of the data in both the 1984 and 1985 final budgets and the 1985 and 1986 provisional budgets show a decrease in R&D expenditure on the production, distribution and rational use of energy (-10% and -15.5% respectively). This change is due to cut-backs on the part of the Federal Government and the *Länder*. The most severely affected area is nuclear energy (e.g. fast breeder reactors) (heading 5.2); there are also decreases in expenditure on fossil energy sources (heading 5.1) and coal technology (heading 5.5).

Chapter 6

During the periods under consideration, R&D expenditure on agricultural productivity and technology increased only at a below-average rate: according to the final budget, there was an increase of $+4.7\%$ in 1985 over 1984, while the 1986 provisional budget indicates that an increase of $+1.8\%$ over 1985 is to be expected. In 1985, for example, there are increases in the field of fisheries research (heading 6.2) and in that of foodstuffs technology (heading 6.6). The main emphasis in this chapter is placed on heading 6.4.

Chapter 7

Research expenditure on industrial productivity and technology shows an upward trend. This applies in particular to a comparison of the data in the 1984 and 1985 final budgets, which shows an increase of $+27.8\%$. Much of this increase is to the benefit of civil aircraft manufacturing (heading 7.5); headings 7.1 and 7.2 also benefit to an above-average degree, particularly through increases in Federal expenditure on indirect research promotion (e.g. in the staff costs subsidy programme) and on indirect-specific promotion (e.g. in manufacturing techniques). Marked increases in expenditure by the *Länder* are mainly to the benefit of headings 7.0 and 7.7.

As compared with 1985, the provisional budget for 1986 shows a further increase in R&D expenditure ($+4.9\%$). Once again, indirect promotion measures relating to research personnel account for part of that increase, as does R&D expenditure in the field of electronic components. During this period, however, there is a marked decline in civil aircraft manufacturing. As before, headings 7.1, 7.2 and 7.5 together account for over two thirds of the total expenditure under Chapter 7.

Chapter 8

Increases of almost the same magnitude in R&D expenditure under the chapter 'Social structures and relationships' can be perceived during both of the periods under consideration: in the final 1985 budget they amount to $+6.5\%$ as compared with 1984, while the provisional 1986 budget once again shows a rise of $+6.4\%$ with respect to 1985. For 1985, this change is due to increases in expenditure by the *Länder* under headings 8.4 and 8.7; Federal expenditure in that year was mainly to the benefit of headings 8.6 and 8.3. For 1986, the increases are accounted for principally by intensified support for the new generation of highly qualified science graduates. Expenditure under this chapter is concentrated mainly on heading 8.1.

Chapter 9

Whereas the increase in R&D expenditure on space research and utilization in 1985 as compared with 1984 (final budget) is just below the average, a well-above-average increase (+ 17.7%) over 1985 is to be expected for 1986 (provisional budget). In 1985, it was mainly heading 9.1 which benefited from a considerable increase, and it is here that the main thrust under this chapter lies. In 1986, however, in contrast to the other headings in this chapter, there is a decline in expenditure with respect to the corresponding data for 1985.

Chapter 10

According to the available data for 1985, the general university research funds, which are financed mainly from the *Länder* budgets, increased by 4.4% over 1984 (final budget). The increase under heading 10.4 is here above average; this is partly due to a change in method (R&D expenditure on veterinary medicine being included, from 1985, under agricultural sciences and not, as was previously the case, under medical sciences (heading 10.3).

For 1986, according to the provisional figures, an increase of over 4% in the expenditure under this chapter is again to be expected. Most of the expenditure is accounted for by heading 10.1.

Chapter 11

Expenditure on non-oriented research increased both in 1985 as compared with 1984 (final budget) and in 1986 as compared with 1985 (provisional budget), these increases being 7.9% and 5.2%, respectively. The first three headings in this chapter benefited from considerable increases in Federal expenditure in both periods. As regards expenditure by the *Länder*, headings 11.0 and 11.1 showed substantial increases for 1985 as compared with 1984, but according to the available data these are not being maintained in 1986, so that a decline in expenditure is occurring here. About 12% of the total R&D expenditure in 1986 falls to Chapter 11 (in 1985 the figure was still 11.4%), and the greater part of that expenditure is concentrated on heading 11.1 (mathematics and natural sciences).

Chapter 13

The final figures for 1985 show a very great increase over 1984 in expenditure on defence research (+ 29.5%), which is accounted for mainly by research and development expenditure on a bomber and a fighter aircraft.

The provisional figures for 1986 show an increase of only 6% over 1985 in expenditure under this chapter.

4.2. France

4.2.1. Government appropriations for R&D totalled FF 67 500 million in 1984, an increase of FF 5 100 million or 8.2% over 1985. As the R&D price index rose by 6.4% in the same period, this means that government R&D financing increased by 1.7% in real terms, well below the average of 6.4% over the period 1980-85.

It seems from a comparison of provisional budgets for 1985 and 1986 that in this period government R&D appropriations will increase by more than the above average.

4.2.2. An examination by objectives of the variations between 1984 and 1985 gives the following breakdown on either side of the increase in R&D prices (6.4%):

Nominal rate of change (1985/84) (%)

(a) Objectives with a nominal growth equal to or greater than the rise in R & D prices	
8 – Social structures and relationships	74
3 – Control of environmental pollution	36
7 – Industrial productivity and technology	18
4 – Protection and improvement of human health	12
5 – Production, distribution and rational utilization of energy	9
2 – Infrastructure and general planning of land use	9
9 – Exploration and exploitation of space	9
11 – Non-oriented research	9
All objectives	8
1 – Exploration and exploitation of the earth	8
(b) Objectives with a nominal growth below the rise in R & D prices	
10 – Research financed from general university funds	6
6 – Agricultural productivity and technology	3
13 – Defence	1

The substantial increase in objective 8 (social structures and relationships and the virtual lack of change in the defence objective 13 are due to the reasons given in the previous report.¹

Firstly, identification of military spending has been improved, leading to a broadening of the basis for evaluation of R&D appropriations in 1984, to which the 1985 data refer.

Secondly, although the basis for the evaluation of civil R&D spending remained unchanged, appropriations were reclassified to the various objectives and some of the funds were grouped together in Chapter 8.

¹ Within the basis for evaluation of civil R&D spending, which has remained unchanged, a set of appropriations consisting of FF 140 million allocated to Chapter 11 and an overall amount of FF 480 million divided between all the other chapters except Chapters 10 and 13 in 1983 was incorporated under Chapter 8 in 1984 and 1985.

A second set consisting of FF 805 million allocated to Chapter 11 and a total of FF 85 million allocated to the first eight chapters in 1983 has been classified to Chapter 10.

In addition, improved identification of defence R&D appropriations led to the broadening of the basis for evaluation of these appropriations (FF 20.8 million instead of 20.4 million in 1984).

These changes in the basis for evaluation and in the classification to objectives are reflected in the structure of R&D budget appropriations as the following table shows:

Table VIII-2
Government R&D financing classified by groups of objectives

Groups of NABS objectives	Final budgets		Provisional budgets		%
	1984	1985	1985	1986	
2 - 3 - 4 - 8 Human and social objectives	8.9	10.1	10.1	10.4	
1 - 5 - 7 - 9 Technological objectives	26.0	27.1	27.0	27.0	
6 Agriculture	3.7	3.5	3.5	3.6	
10 Research financed from general university funds	12.1	11.9	11.9	11.8	
11 Non-oriented research	14.3	14.4	14.4	15.1	
12 Unclassified research	1.6	1.7	1.7	1.1	
13 Defence	33.4	31.3	31.3	31.0	
Total	100.0	100.0	100.0	100.0	

4.3. Italy

4.3.1. In 1985 government R&D financing totalled LIT 5 314 000 million, an increase of 660 000 million over 1984, giving a nominal growth of 14%. As the R&D price index rose by 9.5% over the same period, this is equivalent to a growth in real terms of 4.2%, well below the average growth rate recorded over the period 1980-85 (11.7%).

A comparison of provisional budgets for 1985 and 1986 indicates, however, that this is likely to be temporary and that Italian R&D appropriations in 1986 should pick up again to the highest multi-annual growth rate of the Community countries.

4.3.2. An examination by objectives of the annual variations between 1984 and 1985 gives the following breakdown on either side of the increase in R&D prices (9.5%):

Nominal rate of change (1985/84) (%)

(a) **Objectives with a nominal growth equal to or greater than the rise in R&D prices**

11 - Non-oriented research	52
3 - Control of environmental pollution	40
13 - Defence	36
7 - Industrial productivity and technology	29
9 - Exploration and exploitation of space	26
10 - Research financed from general university funds	22
All objectives	14

(b) **Objectives with a nominal growth below the rise in R&D prices**

1 - Exploration and exploitation of the earth	- 1
5 - Production, distribution and rational utilization of energy	- 1
8 - Social structures and relationships	- 4
6 - Agricultural productivity and technology	- 13
2 - Infrastructure and general planning of land use	- 17
4 - Protection and improvement of human health	- 37

The following points can be made on those objectives which received a substantial increase in funding in 1985:

(a) appropriations for Chapters 9 (Exploration and exploitation of space) and 13 (Defence) benefited from an appreciable increase as a result of the updating of the space plan and the launching of the programme on aircraft construction and telecommunications in 1984.

Defence accounts for practically 10% of total budget appropriations in Italy, a percentage similar to that in Germany;

(b) the marked increase in funding for Chapters 10 (Research financed from general university funds) and 11 (Non-oriented research) went to all disciplines, with particular emphasis on the exact sciences;

(c) the increase in funds for industry benefited information technology in particular.

As regards chapter appropriations which declined in absolute terms:

(d) the reduction in funding for Chapter 2 (infrastructure and general planning of land use) followed a high level of appropriations in 1984;

(e) the reduction in appropriations for agriculture mainly affected forestry and the timber industry;

(f) the substantial decline in health funding affected mainly biomedical engineering and medicinal products.

For (d) and (e) the main reason lies in a statistical reorganization. For (f) the reduction is due to many causes: first a different evaluation method used by the National Health Fund (law on the financing of health activities) and secondly a reduction in the contribution of ENEA (the main energy research body).

Table VIII-3 gives an overall picture of these variations, showing the reduced share of human and social objectives and agriculture.

Table VIII-3
Government R&D financing classified by groups of objectives

Groups of NABS objectives	Final budgets		Provisional budgets		%
	1984	1985	1985	1986	
2 - 3 - 4 - 8 Human and social objectives	11.9	7.8	10.7	7.4	
1 - 5 - 7 - 9 Technological objectives	48.8	48.6	40.4	44.6	
6 Agriculture	5.0	3.8	5.2	3.7	
10 Research financed from general university funds	20.2	21.7	23.9	28.6	
11 Non-oriented research	5.7	7.6	8.6	7.1	
12 Unclassified research	0.1	0.6	0.2	0.2	
13 Defence	8.3	9.9	11.0	8.4	
Total	100.0	100.0	100.0	100.0	

4.4. The Netherlands

4.4.1. In 1985 the Netherlands R & D budget came to HFL 3 882 million, HFL 23 million up on 1984, giving a nominal growth of 0.6%. As the R & D price index rose by 1.6% in the same period, the Netherlands R & D budget declined slightly in real terms (- 1%).

Nevertheless a comparison of provisional budgets for 1985 and 1986 indicates that the situation is likely to change in 1986.

4.4.2. Classified by NABS objectives, the annual variations between 1984 and 1985 give the following breakdown on either side of the increase in R & D prices (1.6%):

Nominal rate of change (1985/84) (%)

(a) **Objectives with a nominal growth equal to or greater than the rise in R & D prices**

7 – Industrial productivity and technology	11
2 – Infrastructure and general planning of land use	4
1 – Exploration and exploitation of the earth	3
9 – Exploration and exploitation of space	2

(b) **Objectives with a nominal growth below the rise in R & D prices**

11 – Non-oriented research	1
8 – Social structures and relationships	1
All objectives	1
4 – Protection and improvement of human health	- 1
10 – Research financed from general university funds	- 1
13 – Defence	- 2
3 – Control of environmental pollution	- 3
5 – Production, distribution and rational utilization of energy	- 3
6 – Agricultural productivity and technology	- 7

The highest growth was recorded by industry but it is not possible to identify the specific fields most concerned.¹

In contrast the substantial decline in appropriations for agriculture affects all research areas in that sector.

The moderate fall (1%) in general university funds is significant since this sector swallows up almost half the total R & D budget appropriations in the Netherlands.

These variations are reflected in the following structural changes:

Table VIII-4
Government R & D financing classified by groups of objectives

Groups of NABS objectives	Final budgets		Provisional budgets		%
	1984	1985	1985	1986	
2 – 3 – 4 – 8 Human and social objectives	14.0	14.0	14.0	13.1	
1 – 5 – 7 – 9 Technological objectives	17.2	18.0	18.0	22.8	
6 Agriculture	5.0	4.6	4.6	4.4	
10 Research financed from general university funds	47.0	46.3	46.3	43.0	
11 Non-oriented research	9.8	9.8	9.8	9.8	
12 Unclassified research	3.9	4.3	4.3	4.3	
13 Defence	3.1	3.0	3.0	2.6	
Total	100.0	100.0	100.0	100.0	

A comparison of provisional budgets for 1985 and 1986 indicates that the trend mentioned above will intensify.

4.5. Belgium

4.5.1. Total government R & D financing in the national budget was BFR 29 300 million in 1985, 2 500 million up on 1984, reflecting a rise of 9.4% in nominal terms. With the R & D price index up by 5.4%, this means that government research appropriations expressed in 1980 prices and exchange rates increased by 3.7%, bringing Belgium back to a real level higher than in 1981.

However, prospects for 1986 that emerge from a comparison of provisional budgets indicate a further fall in government R & D appropriations (expressed in 1980 prices and exchange rates) to below the 1981 level.

4.5.2. A study by objectives of the variations recorded between 1984 and 1985 gives the following breakdown on either side of the increase in R & D prices (5.4%):

¹ Probably for reasons concerning statistical secrecy of data on very large firms.

Nominal rate of change (1985/84) (%)

(a) **Objectives with a nominal growth equal to or greater than the rise in R & D prices**

8 – Social structures and relationships	74
1 – Exploration and exploitation of the earth	18
9 – Exploration and exploitation of space	16
13 – Defence	15
11 – Non-oriented research	14
All objectives	9
2 – Infrastructure and general planning of land use	9
7 – Industrial production and technology	9
6 – Agricultural production and technology	8
4 – Protection and improvement of human health	7
3 – Control of environmental pollution	7

(b) **Objectives with a nominal growth below the rise in R & D prices**

10 – Research financed from general university funds	3
5 – Production, distribution and utilization of energy	2

These wide variations are reflected in the structural changes summarized below:

Table VIII-5

Groups of NABS objectives	Breakdown of government R & D appropriations by groups of objectives			
	Final budgets		Provisional budgets	
	1984	1985	1985	1986
2 – 3 – 4 – 8 Human and social objectives	5.5	5.5	5.4	5.7
1 – 5 – 7 – 9 Technological objectives	39.1	38.8	35.8	36.0
6 Agriculture	7.2	7.1	6.9	7.2
10 Research financed from general university funds	23.4	22.1	21.8	22.8
11 Non-oriented research	21.0	21.8	19.8	20.5
12 Unclassified research	2.4	3.0	8.9	6.3
13 Defence	1.4	1.5	1.5	1.5
Total	100.0	100.0	100.0	100.0

The most outstanding feature is the reduction in the share of research financed from general university funds in total government R & D appropriations (23.4% in 1984, 22.1% in 1985), a relative decline that is likely to continue in 1986.

The other striking point is the fall in the share of energy research in total research spending (12.2% in 1984, 11.3% in 1985), also likely to continue in 1986.

4.6. United Kingdom

4.6.1. The total government funds allocated to R & D in 1985 amounted to UKL 4 582 million, an increase of UKL 274 million or 6.4% over 1984. As the R & D price index went up by 7% in the same period, government research funding showed a very small decline in real terms (- 0.6%).

A comparison of provisional budgets for 1985 and 1986 indicates that this downward trend is unlikely to be reversed.

4.6.2. A calculation by NABS objectives of the annual variations in government R&D funding between 1984 and 1985 gives the following breakdown on either side of the rise in R&D price increase (7%):

Nominal rate of change (1985/84) (%)

(a) **Objectives with a nominal growth equal to or greater than the rise in R&D prices**

8 – Social structures and relationships	47
1 – Exploration and exploitation of the earth	11
13 – Defence	10

(b) **Objectives with a nominal growth below the rise in R&D prices**

9 – Exploration and exploitation of space	7
4 – Protection and improvement of human health	6
All objectives	6
10 – Research financed from general university funds	6
11 – Non-oriented research	3
3 – Control of environmental pollution	2
7 – Industrial productivity and technology	0
6 – Agricultural productivity and technology	- 1
5 – Production, distribution and rational utilization of energy	- 6
2 – Infrastructure and general planning of land use	- 12

The marked increase in funds for Chapter 8 (Social structures and relationships) goes mainly to training activities.

The more moderate increase in defence funding has a substantial impact on the pattern of budget appropriations because of the predominance of defence.

The increase in Chapter 1 (Exploration and exploitation of the earth) goes mainly to marine and ocean research and to mineral prospecting.

In contrast, the substantial fall in appropriations for Chapter 2 (Infrastructure and general planning of land use) mainly affects civil engineering and transport systems.

The impact of these variations on the pattern of R&D appropriations is as follows:

Table VIII-6
Government R&D financing classified by groups of objectives

Groups of NABS objectives	Final budgets		Provisional budgets	
	1984	1985	1985	1986
2 – 3 – 4 – 8 Human and social objectives	7.1	7.2	6.9	7.0
1 – 5 – 7 – 9 Technological objectives	15.7	14.9	15.0	14.8
6 Agriculture	5.0	4.6	4.8	4.6
10 Research financed from general university funds	14.7	14.6	14.2	14.9
11 Non-oriented research	6.8	6.5	7.1	6.8
12 Unclassified research	0.3	0.3	0.3	0.3
13 Defence	50.4	51.9	51.7	51.6
Total	100.0	100.0	100.0	100.0

4.7. Ireland

4.7.1. The Irish R&D budget in 1985 was IRL 75 million, 12.7 million or 20% higher than in 1984. This growth in nominal terms is appreciably higher than the rise in the R&D price index (6.5%) in the same period, giving in 1985 a substantial real growth rate of 13%, the highest figure of all the Member States.

A comparison of provisional data for 1985 and 1986 seems to indicate that this trend will continue.

4.7.2. The variations in government R&D funding between 1984 and 1985 classified by NABS objectives gives the following breakdown on either side of the rise in R&D prices (6.5%):

Nominal rate of change (1985/84) (%)

(a) **Objectives with a nominal growth equal to or greater than the rise in R&D prices**

1 – Exploration and exploitation of the earth	75
7 – Industrial productivity and technology	61
8 – Social structures and relationships	21
All objectives	20
9 – Exploration and exploitation of space	19
10 – Research financed from general university funds	17
6 – Agricultural productivity and technology	14
4 – Protection and improvement of human health	11

(b) **Objectives with a nominal growth below the rise in R&D prices**

5 – Production, distribution and rational utilization of energy	- 15
11 – Non-oriented research	- 17
2 – Infrastructure and general planning of land use	- 29
3 – Control of environmental pollution	- 40

When comparing the financing of different objectives the relatively small amounts going to many of them have to be taken into consideration, as a small increase or decrease in financing can produce a large percentage change.

As the above table shows, the high growth in spending in 1985 was associated with clear choices as regards allocation to objectives.

The high growth in Chapter 8 (Social structures and relationships) is aimed primarily at training activities while the increase for Chapter 7 (Industry) is designed mainly to increase industrial efficiency and competitiveness.

Similarly, money for agricultural research, an objective which swallows up almost one third of government R&D spending, is being diverted from general research towards research in specific fields. This trend is confirmed by an examination of Chapters 10 (University research) and 11 (Non-oriented research) where there is a marked reduction in appropriations for the agricultural sciences.

The impact of these trends on the pattern of government R&D appropriations is reflected in the following table:

Table VIII-7
Government R&D financing classified by groups of objectives

Groups of NABS objectives	Final budgets		Provisional budgets		%
	1984	1985	1985	1986	
2-3-4-8 Human and social objectives	20.7	16.7	19.6	17.5	
1-5-7-9 Technological objectives	25.6	32.7	27.7	29.1

13 Defence	-	-	-	-	
Total	100.0	100.0	100.0	100.0	

4.8. Denmark

4.8.1. In 1985 government R&D spending totalled DKR 3 409 million, which was 307 million or 12% more than in 1984. With the R&D price index up by 4.5%, government R&D spending increased in real terms by 7.4% in 1985. This is in line with the average trend recorded over the period 1980–85 (6.9%).

A comparison of provisional budgets for 1985 and 1986 indicates, however, that the average trend is likely to weaken slightly.

4.8.2. Considered by objectives, the variations in government appropriations give the following breakdown on either side of the rise in R&D prices (4.5%):

Nominal rate of change (1985/84) (%)

(a) **Objectives with a nominal growth equal to or greater than the rise in R&D prices**

7 – Industrial productivity and technology	43
8 – Social structures and relationships	27
11 – Non-oriented research	22
5 – Production, distribution and rational utilization of energy	19
2 – Infrastructure and general planning of land use	16
All objectives	12
9 – Exploration and exploitation of space	9
3 – Control of environmental pollution	9

(b) **Objectives with a nominal growth below the rise in R&D prices**

4 – Protection and improvement of human health	3
6 – Agricultural productivity and technology	0
10 – Research financed from general university funds	– 3
1 – Exploration and exploitation of the earth	– 12
13 – Defence	– 20

The impact of these wide variations on the pattern of government R&D appropriations is summarized in the following table:

Table VIII-8

Government R&D financing classified by groups of objectives

Groups of NABS objectives	Final budgets		Provisional budgets		%
	1984	1985	1985	1986	
2-3-4-8 Human and social objectives	11.1	11.4	11.1	11.5	
1-5-7-9 Technological objectives	27.6	32.0	30.8	31.8	
6 Agriculture	8.4	7.4	7.7	7.0	
10 Research financed from general university funds	35.9	31.0	32.9	29.5	
11 Non-oriented research	16.3	17.7	16.8	19.7	
12 Unclassified research	-	-	-	-	
13 Defence	0.7	0.5	0.7	0.5	
Total	100.0	100.0	100.0	100.0	

Technological objectives have increased more than the others, particularly research financed from general university funds and, within that category, research on health.

4.9. Greece

4.9.1. In 1985 actual government spending on R&D was DR 11 600 million, an increase of 2 700 million over 1984, giving a nominal rise of 30 %. As the R&D price index rose by 19.3%, government financing of R&D increased by 9 % in real terms during 1985.

A straightforward comparison of provisional budgets for 1985 and 1986 might seem to indicate that spending will fall in real terms in 1986 but it appears that this is because of an over-evaluation of the expenditure initially planned.

4.9.2. The variations in government research funding give the following breakdown on either side of the rise in the R&D price index (19.3%):

Nominal rate of change (1985/84) (%)

(a) **Objectives with a nominal growth equal to or greater than the rise in R&D prices**

3 – Control of environmental pollution	82
7 – Industrial productivity and technology	64
4 – Protection and improvement of human health	60
9 – Exploration and exploitation of space	43
10 – Research financed from general university funds	36
6 – Agricultural productivity and technology	31
All objectives	30
1 – Exploration and exploitation of the earth	22

(b) **Objectives with a nominal growth below the rise in R&D prices**

13 – Defence	10
11 – Non-oriented research	9
8 – Social structures and relationships	8
5 – Production, distribution and rational utilization of energy	6
2 – Infrastructure and general planning of land use	– 81

Leaving aside the wide variations in two related objectives, Chapters 3 (Control of environmental pollution) and 2 (Infrastructure and general planning of land use), it is clear that there is a substantial increase in objectives 7 (Industry) and 4 (Health):

- (i) the increase in appropriations for industry is due mainly to the setting-up of new technological research centres (computing, genetic engineering) under the 1984 programme and better provision for existing centres;
- (ii) the increase in appropriations for health is due not only to better budget provision for medical centres but also to the development of health research programmes carried out in other multi-disciplinary centres.

The increase in money for the universities, less marked than for the previous objectives, is essentially due to a rise in the number of research scientists. The same is true of the increase in appropriations for agriculture, where government financing remains predominant.

The increase in space funding results from international commitments concluded at European level.

These variations lead to structural changes summarized in the following table:

Table VIII-9
Government R & D financing classified by groups of objectives

Groups of NABS objectives	Final budgets		Provisional budgets		%
	1984	1985	1985	1986	
2 - 3 - 4 - 8 Human and social objectives	18.8	17.2	18.7	19.6	
1 - 5 - 7 - 9 Technological objectives	15.7	16.4	17.0	17.4	
6 Agriculture	26.9	27.1	28.0	24.9	
10 Research financed from general university funds	27.1	28.3	25.4	26.9	
11 Non-oriented research	7.3	6.1	7.3	6.1	
12 Unclassified research	0.7	2.0	0.7	2.2	
13 Defence	3.5	2.9	2.9	2.9	
Total	100.0	100.0	100.0	100.0	

Despite the increase in health spending, the share of human and social objectives has declined to the benefit of all other objectives except non-oriented research.

5. R&D budget appropriations going to enterprises

5.1. Type

For the purposes of the surveys on government financing of R&D, enterprises are defined as in the European system of integrated economic accounts (ESA) and therefore include both public and private enterprises and non-profit institutions recognized as independent legal entities in the following three sectors:

- (a) non-financial corporate and quasi-corporate enterprises;
- (b) credit institutions;
- (c) insurance enterprises;

while the R&D payments to be taken into consideration are essentially:

- (i) purchases of research services;
- (ii) current transfers (production subsidies);
- (iii) capital transfers (investment grants);
- (iv) loans and investments in the capital of research companies.

Insofar as they do not pass through the companies' general university funds, these payments are included regardless of the channels through which they reach the enterprise: direct transfer or via one or more intermediate bodies (distribution funds, credit institutions, etc.).

This budgetary approach can give figures very different from the results of the OECD statistical surveys (see Section 1.2.3). A substantial share of the budget appropriations intended for enterprises which are paid to intermediate bodies may be used by these bodies for their own research. The money actually received by the enterprises may then fall well short of the appropriations actually intended for them.

Consequently great caution is called for in comparing Community and OECD figures for payments to enterprises.

5.2. Amount

Even though they do not cover all the Member States, the figures for grants paid to enterprises for R&D (see Table IX for 1985) do throw some light on the scope and structure of the funds allocated.

Overall the larger countries allocate a bigger share of their government R&D funding to enterprises than the smaller ones: United Kingdom (39%), Germany (30%), France (26%), Italy (20%), Ireland (13%), the Netherlands (10%).

In the larger countries, the proportion of government financing going to research in enterprises depends greatly on the importance of defence and on the contracts concluded between the State and private enterprises in those countries.

Considering only appropriations to enterprises for civil R&D, we see that the share of these appropriations in the total civil R&D budget falls within a narrower range: Germany (23%), Italy (22%), France and Ireland (13%), United Kingdom (11%), the Netherlands (10%).

In 1985 the share of civil R&D in the total funds for enterprises fell only in Germany. While total budget appropriations paid to enterprises for R&D rose by 13.4% in 1985, funds for civil R&D alone were up by only 5.5%.

In 1985 the total R&D appropriations for enterprises increased in the Netherlands and the United Kingdom at a rate similar to that recorded in Germany. In Ireland and Italy, by contrast, appropriations increased sharply by 121% and 45% respectively.

Leaving aside defence, the main objective to benefit from grants to enterprises was of course industrial technology, and its share increases as defence becomes less important (see Table IX): Ireland (100%), France (84%), Italy and the Netherlands (83%), Germany (31%), United Kingdom (11%).

Within Chapter 7 (Industrial technology), Ireland (where funds for this objective more than doubled in 1985) and the Netherlands put the main emphasis on increasing industrial efficiency and competitiveness while the United Kingdom spent more on developing means of transport. In Germany and Italy, the effort is more equally divided over all industrial branches.

In the United Kingdom and France, since almost all of the defence appropriations intended for enterprises went to Chapter 7, the share of this objective in total funds for enterprises was in fact comparable to the percentages for Italy and the Netherlands.

Mention should be made of the importance Germany attaches to funds for energy R&D by enterprises, the main focus of which was nuclear fission research. However, it should not be concluded from this that the other countries neglect research by enterprises in this sector. The differences between Member States result largely from the fact that own funds put up by public enterprises in this field are not taken into account in total R&D budget appropriations.

Table IX
Breakdown of R&D budget appropriations going to enterprises¹
1985

¹ The structural differences in the organization of business activities in different countries can distort the pattern of R&D financing going to business enterprises.

6. Multilateral cooperation

R&D funds for multilateral cooperation are included in the total amount of R&D only if they are entered in the central government budget as defined in the European system of integrated economic accounts (ESA). Informal collaboration and intramural support for multilateral projects are excluded from the analysis.

The comparison of multilateral cooperation figures for different countries is distorted if defence is taken into account, for a number of reasons:

- (i) of the large countries, the Federal Republic of Germany and the United Kingdom devote a far higher proportion of their cooperation appropriations to defence than the other countries: Germany (19%), United Kingdom (43%), compared with only 2% for the other countries excluding France;
- (ii) for some countries, including France, it is very difficult to single out cooperation appropriations from the general defence research budget;
- (iii) the nature of defence cooperation depends greatly on the size of the country: small countries make greater use of multilateral cooperation whereas the larger ones prefer to enter into bilateral agreements.

For all these reasons it seems preferable to confine the comparative analysis to the cooperation appropriations for civil R & D as shown in Table X.

This table demonstrates the following similarities:

- (i) in 1985 the three large countries devoted a higher proportion of their overall civil R & D budget to international cooperation than the other countries;
- (ii) all countries gave priority to two objectives in international cooperation: basic research (objectives 10 and 11) and space (European Space Agency programmes).

Most of the space research funding comes from international cooperation, as is shown by the percentages of cooperation appropriations in total appropriations for space research: Germany (74%), France (56%), Italy (43%), the Netherlands (25%), United Kingdom (85%), Ireland (100%), Denmark (88%).

Over and above these similarities, there are differences in emphasis which depend on national policies and choices:

- (i) Ireland gives preference to agricultural research in its cooperation activities, just as it does domestically, and to a lesser extent to industry. However, R & D on objective 8 (Social structures and relationships) while receiving a relatively small amount of money, occupies a prominent position out of all proportion to the situation in the other countries, the aim being to develop research activities in the field of training and education;
- (ii) in the United Kingdom, industrial research and particularly research on means of transport is of greater importance in civil R & D cooperation than at the national level;
- (iii) the Netherlands supports cooperation on energy and exclusively in the field of nuclear fission although that objective has no national priority;
- (iv) the Federal Republic of Germany and France encourage international cooperation in energy and industrial research, two fields that also receive support at home.

Finally, national priorities for energy (Italy) and industry (Italy, Denmark) are not reflected in international cooperation.

Table X
Multilateral cooperation appropriations for civil R&D
1985

Share of civil R&D cooperation appropriations in total government R&D funding (%)	11.6	13.7	5.6	3.1	—	10.6	5.3	6.4	—	—	—

7. Cooperation in the Community institutions

The Community institutions participate directly or indirectly in civil research projects. The relevant amounts, which are not normally included in national R&D expenditure, are shown separately in the tables.

The money contributed by these institutions to research programmes in 1985 amounted to 573 million ECU, 2.2% of all government research funding for civil R&D.

Reference to the figures alone would seem to indicate that research appropriations from the Community institutions were almost 30% up in 1985 compared to 1984. However, these figures are not comparable. Up to 1984 only actual expenditure obtained from accounting documents was taken into account. In 1985, however, returns were aligned on the procedure used by the Member States, i.e. the figures are based on appropriations taken from budget documents. Consequently caution is called for in comparing figures for 1984 and 1985.

Nevertheless, Table VII indicates two main trends concerning the energy and industrial objectives. There is a substantial reduction in energy's share of total R&D appropriations as a result of a cut in spending on nuclear fission, and a large increase in funding for information technology research.

A comparison of 1985 and 1986 budgets established on a similar basis shows that total R&D spending is likely to increase by 14% over that period (see Table 5 in the statistical annex).

8. Attempt to evaluate government R&D appropriations for biotechnology, information technology and the developing countries

This chapter covers research which inherently cuts across a whole range of NABS objectives and is of vital importance for Europe. The three fields involved are biotechnology, information technology and developing countries.

Because of the degree of uncertainty in identifying defence appropriations for all these three research areas and the difficulty of collecting data from universities carrying out R&D in these fields, the amounts of government financing intended for biotechnology, information technology and developing countries set out in the series of Tables XI apply only to civil R&D and exclude general university funds (GUF).

8.1 Biotechnology

Generally speaking the definition of biotechnology R&D adopted by the subcommittee agrees with the OECD definition of biotechnology but confines it to R&D activities.

Examination of Table XI-1 shows that countries generally devote 1 to 2% of their civil research appropriations to biotechnology R&D with the exception of Ireland and to a lesser extent Greece.

The high proportion of government financing for civil research that goes to biotechnology R&D in Ireland (6.4%) is due partly to the very large increase in these appropriations in 1985 (+ 66%) reflecting the emphasis on agricultural and food research in Ireland.

This increase is even more marked if we consider only appropriations intended for biotechnology R&D in industry (+ 116%). Within this sector, it is even higher if we take only appropriations designed to promote industrial efficiency and competitiveness (+ 172%). This extremely substantial increase is in line with a general policy already discussed during the analysis of financing for enterprises.

Another objective also occupies a prominent position in biotechnology R&D. This is agriculture, financing for which rose substantially in 1985 (+ 23%). Here again this increase reflects the general priority for agriculture carried over into biotechnology.

Overall the budget appropriations for biotechnology R&D in Greece increased by more than 100% in 1985. Biotechnology R&D in industry rose by the same proportion but growth rates exceeding 300% were recorded for objectives concerning pollution, health and agriculture, the last still being one of the main national priorities for R&D.

In Germany, France and the United Kingdom, R&D appropriations for biotechnology did not increase to the same extent as in the two countries mentioned above. It is not so much the rate of increase as the structure of R&D spending on biotechnology that is of interest in these countries.

All three give priority to biotechnology R&D in agriculture, industry and non-oriented research. It is worth noting that unlike other trends in the United Kingdom, the trend in the allocation to biotechnology R&D is the result of a definite policy and not a coincidence of policies by different ministries. Only France would appear to attribute less importance to biotechnology R&D in industry, but that is partly due to the size of the item 'other research'.

There are differences as well as similarities between these countries. Biotechnology R&D in the health sector is not given as high a priority in the United Kingdom as in the other two countries. Similarly biotechnology R&D in the field of environmental pollution control is non-existent or insignificant in France and in the United Kingdom. Biotechnology R&D under the objective 'social structures and relationships' in the Federal Republic of Germany is devoted mainly to training activities in that field of research.

Taking the Community as a whole, biotechnology R&D accounts for a similar proportion of civil R&D as in the three countries mentioned above. However, it is far more concentrated, especially on agriculture and health, while biotechnology R&D in industry is confined to petrochemistry and coal chemistry.

8.2. Information technology

Figures for information technology R&D are particularly blurred in the large countries (Germany, France and the United Kingdom) because of the lack of information on defence appropriations for research in this field. In these countries, or at least in France and the United Kingdom, appropriations for information technology R&D in the civil sector are probably only a minor part of total appropriations for such research.

Considering civil R&D alone (excluding GUF), Table XI-2 shows the same general finding as for biotechnology. Apart from Ireland, the countries devote around 4-5% of their civil R&D appropriations to information technology.

The substantial share of civil appropriations going to information technology R&D in Ireland (11.6%) in 1985 is also due to the reasons mentioned earlier: a broad interpretation of the concept of information technology which takes account of its economic and social implications, and the high increase in public appropriations for such research in 1985 (+ 184%).

Industry is obviously the main beneficiary by a very long way (92%). Here again most of the money is designed to increase industrial efficiency and competitiveness.

Naturally the other countries also give priority to industry research in this field, the proportion in Germany being similar to that of Ireland. They also provide generous financing for non-oriented research related to information technology R&D, with the exception of Germany where some of this research has to be financed by industry.

However, there are significant differences from one country to another as well as these similarities.

A significant share of information technology R & D financing in France goes to energy rather than industry, probably because of the importance of State enterprises in that sector. Similarly France allocates an even higher proportion of these appropriations to social structures and relationships, probably as a result of the reclassification of objectives in 1984 (see Section 4.2.).

Germany includes in Table XI-2 space appropriations which the other countries include under international cooperation appropriations.

In the United Kingdom a proportion, although a modest one, of information technology R & D appropriations goes to the exploration and exploitation of the earth (the same is incidentally true of biotechnology) for research of a general nature.

To wind up, mention should be made of the significant effort being made in the European Community in information technology R & D through the arrangements made under the Esprit programme.

8.3. Developing countries

There are two possible approaches to R & D for the benefit of developing countries: either the projects relate exclusively to the developing countries or they are of interest to the developing countries but also pursue a more general objective. The predominant approach varies from one country to another.

France is a typical example of the first approach. Here most of the research concerning the developing countries is done by two institutes: the Research Office for Overseas Scientific and Technical Development (Orstom) and the Study and Research Group for the Development of Tropical Agriculture.

In the other countries, R & D relevant to the developing countries is not as specific and it is more difficult to identify its share in the many different programmes or institutions engaged in such research.

This difference partly explains the wide deviation between the figures for France and for the two other countries (see Table XI-3).

The main objectives under which R & D for development is classified are obviously agriculture, industry and health.

However, Germany does not give any particular priority to health and instead is stepping up R & D in the energy sector, especially on new sources and energy conservation.

The efforts made by France in the exploration and exploitation of the earth and by the United Kingdom in the general planning of land use should also be mentioned.

Community R & D appropriations for the benefit of the developing countries are divided between health and agriculture, with medical research playing a much more prominent part than in the individual countries.

In general there is a possibility of overlaps between R & D in biotechnology and/or information technology and R & D related to developing countries. This makes it extremely difficult to collect quantitative data on these research areas.

Calculation of the R & D price index

The price index prepared to deflate R & D financing is defined by the equation:

$$I^{(t+n)} = \sum_i \omega_i \frac{P_i(t+n)}{P_i(t)}$$

$$\text{where } \sum_i \omega_i = 1$$

and t and t+n are two years under consideration

ω_i ($i = 1, 2, 3$) are the weightings

$P_i(t)$ ($t = 1, 2, 3$) are the corresponding prices for year t.

1. The weightings correspond to the shares of government expenditure that can be allocated to the following three expenditure categories:

- (i) wage and salary expenditure;
- (ii) other current expenditure;
- (iii) capital expenditure.

The data for evaluating these allocations are obtained from the OECD international statistical surveys.

2. Data on prices are obtained from the European system of national accounts and are defined as follows:

$P_1(t)$ per capita remuneration;

$P_2(t)$ general consumer price index;

$P_3(t)$ index of gross fixed capital formation.

Methodological notes

R&D objectives

The Nomenclature for the analysis and comparison of scientific programmes and budgets (NABS), 1983 version, is used for the breakdown of data.

Government financing

This is financing by central government as defined by the European system of national accounts (ESA). This definition includes the 11 *Länder* in the Federal Republic of Germany.

It should be noted that there are breaks in the continuity of the figures for five countries.

There has been a slight discontinuity in the Italian series since 1973. Since then a small percentage of R&D relating mainly to human health and agriculture has gradually been transferred from the central government budget to the budgets of the regions which now are excluded from the survey. The effects of this transfer cannot be accurately estimated but are thought to be around 1–2%. They go some way to explaining the marked irregularity in the Italian figures for that period. Changes in the methods, timing of the surveys and definitions of R&D coefficients are responsible for a lack of continuity in the figures for the United Kingdom in the period 1974 to 1976, for the Federal Republic of Germany between 1976 and 1977 and for Ireland between 1977 and 1979, where a continuous process of improving definitions has been instituted. For Belgium, the adoption of new methods of breaking down the science policy budget is responsible for a break in the continuity of the series from 1978.

In addition, unlike previous years, the United Kingdom included in its budget for 1979–80 a provision to cover the increase in prices during the period between the passing of the budget and its implementation. This provision represents on average 8–9% of the total financing.

The Danish data do not refer to an actual R&D budget. They are estimated from coefficients dating back to 1982 and must therefore be interpreted with some caution.

The regular collection of data on Greek R&D activities started in the late 1970s. The first survey of government research spending supplemented by estimates of the R&D workforce was made in 1977 and repeated in 1978. These figures included research spending by a few large public-sector undertakings (electricity, posts and telecommunications, oil, etc.). Since the collection of figures for actual expenditure delayed the provision of data and was not in line with the Community system, a number of innovations were made in 1983:

- (i) public undertakings were excluded from the scope of the survey;
- (ii) the recording of actual expenditure was abandoned;
- (iii) total figures for each research centre were recorded;
- (iv) research coefficients were applied to the figures recorded for higher education.

These changes are obviously the reason for the break in the series mentioned in the report.

Total R&D financing

For 1975 to 1985, the total appropriations for R&D in the final budgets of the Member States, including revisions to the budgets during the budgetary year, are used; for 1986, the figures in the provisional budgets are used.

Two separate questions arise concerning the use of data from provisional budgets:

- (a) the value of these data in predicting minor changes in structure that occur from one year to another. It seems inherently probable that the guidance will be valuable and broadly speaking this has been confirmed by the analysis of final budgets once they become available. This report has been written on the assumption that the provisional budgets for 1982 and 1983 provide reliable warning of changes in pattern and structure.

- (b) the value of these data in providing a forecast of the volume of expenditure. Here the difficulties are greater but the important point is not so much the absolute size of the differences between provisional and final budgets as their relative size and the changes in the budgets from one year to the next. No clear-cut conclusions can be drawn from the evidence available but it suggests that the relationship differs from one country to another.

This is not surprising in itself as the institutional relationship between the two budgets varies in different countries. The total amount of the provisional budget appears to be information valuable enough to justify the use made of it in Table II but not to warrant its inclusion in the main tables on the same footing as final budgets.

Total budgets

The figures quoted are taken from the harmonized statistics prepared by DG II (Economic and Financial Affairs) of the Commission. The definitions correspond to those normally used in discussion of government financing of R&D but are not always identical with those most commonly used in the Member States.

Population

The figures used are the harmonized estimates of mean population over the year, prepared by Eurostat.

Data on European Communities expenditure

The figures are based on the Commission's budget documents. They include R&D financing by the European Coal and Steel Community but not funding of technological research by the European Development Fund, which is financed directly by the Member States. Up to 1978, Commission appropriations were expressed initially in budget units of account equal to one United States dollar or 50 Belgian francs at 1970 rates of exchange. They were then converted into EUA. As the budget has been expressed in EUA since 1978, previous budgets have also been converted into that unit. Following the adoption of the ECU in 1979, the Community institutions have used it for the presentation of data since 1981.

Comparison between EUR 12, the United States and Japan

The US figures are taken from the following publications: *Science resource studies – Highlights*, NSF 85-322 by the National Science Foundation and *Survey of current business* by the US Department of Commerce. The Japanese figures are taken from OECD international surveys of R&D resources.

Gross domestic product (GDP)

The figures for gross domestic product have been prepared in accordance with the European system of integrated economic accounts (ESA).

Figures in current values

These amounts are expressed in national currencies and in EUA. i.e. units of accounts calculated by converting the national currencies at either the central rates or at the market rates depending on the country (see Eurostatistics, Data for short-term economic analysis). For conversion into ECU, the averages of the rates of exchange for each year have been used, except for comparison of the last two years, which was based on the rates in March 1985 and 1986 (see Table 16.2 of the statistical annex).

Figures in constant terms

The figures in current national currencies have been deflated for the period 1980–86 by the R&D price index. For 1986, deflation was based on an estimate of the R&D price index, using data from 'Economic forecast 1986–87, April–May 1986' by DG II.

Statistical data

Symbols and abbreviations		
EUA/UCE	Statistical unit of account (based on central market rates)	
GDP/PIB	Gross domestic product (GDP)	
Mio/mio	Million	
Mrd/mia	Thousand million	
p	Provisional	
.	Data not available	
-	Nil	
0 (0.0)	Less than half of the unit used The symbols +, 0 and – in the tables which contain calculations of mean trends are used to indicate whether the values for the latest year are above, on, or below the mean trend line (regression)
