Eurostat hat die Aufgabe, den Informationsbedarf der Kommission und aller am Aufbau des Binnenmarktes Beteiligten mit Hilfe des europäischen statistischen Systems zu decken.

Um der Öffentlichkeit die große Menge an verfügbaren Daten zugänglich zu machen und Benutzern die Orientierung zu erleichtern, werden zwei Arten von Publikationen angeboten: Statistische Dokumente und Veröffentlichungen.

Statistische Dokumente sind für den Fachmann konzipiert und enthalten das ausführliche Datenmaterial: Bezugsdaten, bei denen die Konzepte allgemein bekannt, standardisiert und wissenschaftlich fundiert sind. Diese Daten werden in einer sehr tiefen Gliederung dargeboten. Die Statistischen Dokumente wenden sich an Fachleute, die in der Lage sind, selbständig die benötigten Daten aus der Fülle des dargebotenen Materials auszuwählen. Diese Daten sind in gedruckter Form und/oder auf Diskette, Magnetband, CD-ROM verfügbar. Statistische Dokumente unterscheiden sich auch optisch von anderen Veröffentlichungen durch den mit einer stilisierten Graphik versehenen weißen Einband.

Veröffentlichungen wenden sich an eine ganz bestimmte Zielgruppe, wie zum Beispiel an den Bildungsbereich oder an Entscheidungsträger in Politik und Verwaltung. Sie enthalten ausgewählte und auf die Bedürfnisse einer Zielgruppe abgestellte und kommentierte Informationen. Eurostat übernimmt hier also eine Art Beraterrolle.

Für einen breiteren Benutzerkreis gibt Eurostat Jahrbücher und periodische Veröffentlichungen heraus. Diese enthalten statistische Ergebnisse für eine erste Analyse sowie Hinweise auf weiteres Datenmaterial für vertiefende Untersuchungen. Diese Veröffentlichungen werden in gedruckter Form und in Datenbanken angeboten, die in Menütechnik zugänglich sind.

Um Benutzern die Datensuche zu erleichtern, hat Eurostat Themenkreise, d. h. eine Untergliederung nach Sachgebieten, eingeführt. Daneben sind sowohl die Statistischen Dokumente als auch die Veröffentlichungen in bestimmte Reihen, wie zum Beispiel „Jahrbücher“, „Konjunktur“, „Methoden“, untergliedert, um den Zugriff auf die statistischen Informationen zu erleichtern.

Y. Franchet
Generaldirektor

It is Eurostat's responsibility to use the European statistical system to meet the requirements of the Commission and all parties involved in the development of the single market.

To ensure that the vast quantity of accessible data is made widely available, and to help each user make proper use of this information, Eurostat has set up two main categories of document: statistical documents and publications.

The statistical document is aimed at specialists and provides the most complete sets of data: reference data where the methodology is well-established, standardized, uniform and scientific. These data are presented in great detail. The statistical document is intended for experts who are capable of using their own means to seek out what they require. The information is provided on paper and/or on diskette, magnetic tape, CD-ROM. The white cover sheet bears a stylized motif which distinguishes the statistical document from other publications.

The publications proper tend to be compiled for a well-defined and targeted public, such as educational circles or political and administrative decision-makers. The information in these documents is selected, sorted and annotated to suit the target public. In this instance, therefore, Eurostat works in an advisory capacity.

Where the readership is wider and less well-defined, Eurostat provides the information required for an initial analysis, such as yearbooks and periodicals which contain data permitting more in-depth studies. These publications are available on paper or in videotext databases.

To help the user focus his research, Eurostat has created 'themes', i.e. subject classifications. The statistical documents and publications are listed by series: e.g. yearbooks, short-term trends or methodology in order to facilitate access to the statistical data.

Y. Franchet
Director-General

Pour établir, évaluer ou apprécier les différentes politiques communautaires, la Commission européenne a besoin d'informations.

Eurostat a pour mission, à travers le système statistique européen, de répondre aux besoins de la Commission et de l'ensemble des personnes impliquées dans le développement du marché unique.

Pour mettre à la disposition de tous l'importante quantité de données accessibles et faire en sorte que chacun puisse s'orienter correctement dans cet ensemble, deux grandes catégories de documents ont été créées: les documents statistiques et les publications.

Le document statistique s'adresse aux spécialistes. Il fournit les données les plus complètes: données de référence où la méthodologie est bien connue, standardisée, normalisée et scientifique. Ces données sont présentées à un niveau très détaillé. Le document statistique est destiné aux experts capables de rechercher, par leurs propres moyens, les données requises. Les informations sont alors disponibles sur papier et/ou sur disquette, bande magnétique, CD-ROM. La couverture blanche ornée d'un graphisme stylisé démarque le document statistique des autres publications.

Les publications proprement dites peuvent, elles, être réalisées pour un public bien déterminé, ciblé, par exemple l'enseignement ou les décideurs politiques ou administratifs. Des informations sélectionnées, triées et commentées en fonction de ce public lui sont apportées. Eurostat joue, dès lors, le rôle de conseiller.

Dans le cas d'un public plus large, moins défini, Eurostat procure des éléments nécessaires à une première analyse, les annuaires et les périodiques, dans lesquels figurent les renseignements adéquats pour approfondir l'étude. Ces publications sont présentées sur papier ou dans des banques de données de type vidéotex.

Pour aider l'utilisateur à s'orienter dans ses recherches, Eurostat a créé les thèmes, c'est-à-dire une classification par sujet. Les documents statistiques et les publications sont répertoriés par série — par exemple, annuaire, conjoncture, méthodologie — afin de faciliter l'accès aux informations statistiques.

Y. Franchet
Directeur général

1. Einleitung

1.1. Inhalt der Veröffentlichung

In der vorliegenden Veröffentlichung werden verschiedene Aspekte von Entwicklungen im landwirtschaftlichen Sektor behandelt, die zwischen 1985 und 1996 in der Europäischen Union und ihren Mitgliedstaaten¹ eingetreten sind. Die in der Veröffentlichung enthaltenen Tabellen wurden anhand der SPEL/EU-Daten (Aktualisierung von Dezember 1996) zusammengestellt. Die Ergebnisse für die **drei neuen Mitgliedstaaten** (Österreich, Finnland und Schweden) unterliegen noch umfangreichen Revisionsarbeiten und müssen daher als vorläufig eingestuft werden. Sie wurden aber dennoch in die Veröffentlichung aufgenommen, um so ein vollständigeres Bild für den EU-Agrarsektor zu präsentieren.

Die SPEL/EU-Daten geben im Rahmen eines prozeßanalytischen Ansatzes Aufschluß über die Output-Entstehung und Input-Verwendung in der Landwirtschaft. Sie tragen dem intersektoralen Output- und Input-Strom zwischen dem landwirtschaftlichen und nichtlandwirtschaftlichen Sektor ebenso Rechnung wie dem intrasektoralen Output- und Input-Strom zwischen den einzelnen landwirtschaftlichen Produktionsaktivitäten. Ferner enthalten sie Informationen über die landwirtschaftliche Bruttowertschöpfung zu Marktpreisen aufgeschlüsselt nach Produktionszweigen.

In Kapitel 1.2. werden die grundlegenden Merkmale des SPEL-Ansatzes erläutert; die Kapitel 1.3. und 1.4. geben einen Überblick über die Module des SPEL/EU-Modells, anhand der die SPEL/EU-Daten erstellt wurden: das Basissystem (BS) und das Kurzfristprognose- und Simulationssystem (SFSS)².

Kapitel 2 enthält eine zusammenfassende Analyse sektoraler Trends in der Europäischen Union anhand der Daten, die in den Tabellen von Kapitel 3 bis 5 enthalten sind.

Kapitel 3 bietet eine Übersicht über die Entwicklung der sektoralen Wertschöpfungskomponenten. Es gibt Aufschluß über die Änderung der Bruttoproduktion und des Vorleistungseinsatzes anhand der Veränderungsrate der Werte, Volumina und "Unit Values" (Durchschnittspreise) differenziert nach Produktgruppen oder Inputpositionen.

In Kapitel 4 werden die wichtigsten landwirtschaftlichen Produktionsaktivitäten bzw. Gruppen von Produktionsaktivitäten behandelt. Dargestellt werden die Entwicklungen bei den Produktionswerten, dem Vorleistungseinsatz und der Bruttowertschöpfung zu Marktpreisen in den einzelnen Produktionszweigen. Die Berechnung einer "modifizierten Bruttowertschöpfung", die Schätzungen der Subventionen umfaßt, die im Rahmen der 1992 beschlossenen Reform der Gemeinsamen Agrarpolitik eingeführt wurden oder hiervon betroffen sind³, ergänzt die Daten über die Wertschöpfung.

¹ Die Daten beziehen sich auf das Gebiet der Europäischen Union vor dem 1. Januar 1995 (EUR 12) und nach dem 1. Januar 1995 (EUR 15). Die Ergebnisse für Deutschland beziehen sich bis 1990 auf die alten Bundesländer und ab 1991 auf die alten und die neuen Bundesländer. Die Ergebnisse auf den Ebenen EUR 12 und EUR 15 wurden durch Aggregation ermittelt.

² Detaillierte methodische Anmerkungen enthält die Veröffentlichung "SPEL System - Methodological Documentation (Rev. 1) - Vol. 1: Basics, BS, SFSS", die von Eurostat im Januar 1995 veröffentlicht wurde.

³ Ausgleichszahlungen je Hektar für Getreide, Ölsaaten und Eiweißpflanzen, Prämie für männliche Rinder und Mutterkühe, Schaf- und Ziegenprämie.

In Kapitel 5 werden abschließend ausgewählte Daten über den Vorleistungseinsatz dargestellt, die für umweltrelevante Fragestellungen von Interesse sein können. Dabei geht es um den Pflanzenschutz- und Düngemiteleinsatz je Hektar.

Die Tabellen in dieser Veröffentlichung wurden anhand von standardisierten Auswertungsroutinen für die SPEL/EU-Daten erzeugt. Die SPEL/EU-Daten sind im Hinblick auf Produktionsaktivitäten, Produkt- und Inputpositionen sehr viel differenzierter als die Tabellen in der vorliegenden Veröffentlichung. Der gesamte Satz von SPEL/EU-Daten für den Zeitraum 1973-1996 steht in der Datenbank NewCronos von Eurostat zur Verfügung und kann von externen Benutzern unter dem Titel "SPEL/EU data for agriculture on CD-ROM 1973-1996" beim Amt für amtliche Veröffentlichungen der Europäischen Gemeinschaften bezogen werden. Weitere Informationen über SPEL finden sich auch auf dem WWW-Server der Europäischen Kommission "EUROPA" (<http://europa.eu.int/en/comm/eurostat/spel/homepage.htm>).

1.2. Allgemeine Merkmale des SPEL-Ansatzes

Das SPEL-System dient der Beobachtung der aktuellen Lage im Agrarsektor, Ex-post-Analysen sektoraler Entwicklungen sowie kurz- und mittelfristigen Prognosen und Simulationen der Auswirkungen alternativer agrarpolitischer Maßnahmen.

Allen SPEL-Modulen liegt der prozeßanalytische Gesamtrechnungsansatz zugrunde:

- Der prozeßanalytische Ansatz stellt eine Unterteilung des Agrarsektors in Produktions- und Verwendungsaktivitäten dar. Im Rahmen dieses Ansatzes werden produktionsbezogene Interaktionen innerhalb des Agrarsektors (intrasektorale Ströme) sowie zwischen der Landwirtschaft und der Nichtlandwirtschaft (intersektorale Ströme) untersucht.
- Dieser Ansatz bietet eine detaillierte Untergliederung der Agrarproduktion in neunundvierzig Produktionsaktivitäten, sechzig Produktpositionen und dreiunddreißig Vorleistungspositionen. Die Darstellung der Produkt- und Inputströme wird durch fünfzehn intrasektorale Verwendungsaktivitäten und eine intersektorale Verwendungsaktivität (Verkäufe/Käufe) ergänzt.
- Durch die Übereinstimmung mit dem Gesamtrechnungsansatz wird die Konsistenz hinsichtlich physischer und monetärer zyklischer Zusammenhänge gewährleistet und die Vergleichbarkeit der Daten und Modellergebnisse mit den in der Landwirtschaftlichen Gesamtrechnung (LGR) verwendeten Definitionen sichergestellt.

Aus dem oben dargestellten Ansatz ergibt sich für jedes dargestellte Jahr und jeden Mitgliedstaat eine "aktivitätsdifferenzierte Gesamtrechnungstabelle" (ABTA=Activity-based Table of Accounts)⁴. Eine ABTA schlüsselt den landwirtschaftlichen Produktionsprozess in Ertrags- und Inputkoeffizienten sowie Anbaufläche und Viehbestand auf. Da in der ABTA ferner die wichtigen intrasektoralen Produktströme zwischen Produktionsaktivitäten und innerhalb einzelner Produktionsaktivitäten (z. B. Jungtiere oder Futtermittel) berücksichtigt werden, liefert sie annähernd realistische Bruttoproduktionswerte. Nach der Aggregation über die Produktionsaktivitäten ist die Summe der nicht konsolidierten (Brutto-) Ströme des SPEL mit der Summe der konsolidierten (Netto-) Ströme der LGR, die den Endproduktionswert enthält, identisch. Die sich daraus ergebende sektorale Bruttowertschöpfung zu Marktpreisen des SPEL stimmt daher mit den Definitionen der LGR überein.

Eine "Zusätzliche Nachfragekomponente", die die physischen Produktströme von der Outputenstehung bis zum Endverbrauch verfolgt, ergänzt die angebotsorientierte ABTA. Dabei wird der Verbrauch der unverarbeiteten landwirtschaftlichen Produkte außerhalb des landwirtschaftlichen Sektors in verschiedene Verwendungsaktivitäten aufgegliedert: menschlicher Verbrauch, Futtermittel, Saatgut, industrielle Verwendung, Verarbeitung, Bestandsveränderungen,

⁴ Die ABTA für die Europäische Union insgesamt werden durch Aggregation der ABTA der Mitgliedstaaten berechnet.

Verluste und Ausfuhren. Ferner werden die Versorgungsbilanzen der unverarbeiteten Produkte (z.B. Raps) mit dem inländischen Aufkommen von Verarbeitungsprodukten (z.B. Rapsöl) über "Verarbeitungsaktivitäten" verknüpft.

Ein weiteres wesentliches Merkmal des SPEL-Ansatzes besteht darin, daß die Menge statistischer Daten nicht als endgültig angesehen wird. Die Gleichungssysteme der Module des SPEL/EU-Modells umfassen mehrere Konsistenzüberprüfungen. Diese sind Ausgangspunkte für kritische Untersuchungen der Datenbank, die in enger Zusammenarbeit zwischen den Modellbauern und den Statistikern von Eurostat und aus den Mitgliedstaaten durchgeführt werden.

1.3. Basissystem

Das Basissystem erzeugt die SPEL/EU-Daten für den Ex-post-Zeitraum (für die vorliegende Veröffentlichung die Daten bis 1995). Hierzu kombiniert es verschiedene Informationsquellen: amtliche Agrarstatistik (hauptsächlich aus den Datenbanken von Eurostat), Daten auf der Grundlage von Betriebsstichproben, technische und betriebswirtschaftliche Daten.

Das BS erstellt die ABTA und die Zusätzliche Nachfragekomponente jedoch nicht direkt auf der Grundlage dieser Zeitreihen, da die Unzulänglichkeiten des statistischen Materials eine vorherige systematische Datenaufbereitung notwendig machen (hauptsächlich Ergänzung fehlender Daten).

Nach Abschluß der Datenaufbereitung integriert das Basismodell (BM) die verschiedenen Arten (aufbereiteter) Daten zur Erstellung der ABTA und der Zusätzlichen Nachfragekomponente. Die Input- und Outputkoeffizienten, der Umfang der Produktionsaktivitäten und die Input- und Outputpreise werden durch rekursive und iterative Ansätze abgeleitet. Klar umrissene Identitätssysteme und Überprüfungsverfahren stellen die Konsistenz der Ergebnisse sicher.

Die Ergebnisse des Basissystems können für Ex-post-Analysen der Entwicklungen von Produktion und Vorleistungseinsatz, Produktivitäten, Preisen und Einkommen herangezogen werden. Noch wichtiger ist jedoch, daß die Ergebnisse des BS Grundlage von kurz- und mittelfristigen Prognosen und Simulationen sind.

1.4. Kurzfristprognose- und Simulationssystem

Das Kurzfristprognose- und Simulationssystem wurde zur Aktualisierung der SPEL/EU-Daten für das Jahr 1996 herangezogen.

Bei der Aktualisierung dient das SFSS zur Schließung der statistischen Datenlücke zwischen dem laufenden Jahr und den für das Vorjahr und das laufende Jahr verfügbaren statistischen Daten. Beispielsweise wurden durch die "routinemäßige" Anwendung des SFSS im Herbst 1996 die SPEL/EU-Daten für 1996 erstellt (Diagnose der aktuellen Situation).

Ferner kann das SFSS für Ex-ante-Prognosen und -Simulationen bis zu einem Jahr angewendet werden. Prognosen, Simulationen und Aktualisierungen mit dem SFSS erfolgen im Rahmen der ABTA. Normalerweise werden folgende Arbeitsschritte durchgeführt:

- Frühzeitig vorliegende statistische Daten und trendgestützte ökonomische Analysen der Outputkoeffizienten, der Umfänge der Produktionsaktivitäten, der Erzeuger- und Vorleistungspreise, der Marktverwendungsaktivitäten und makroökonomischer Variablen (Wechselkurse, BIP-Deflator usw.) sind die Ausgangspunkte für Kurzfristprognosen. Im Rahmen des Kurzfristmodells werden diese Informationen verknüpft und konsistente ABTA erstellt. Die Einkommenskomponenten der LGR sind die zentralen sich daraus ergebenden Variablen. Die in diesem Stadium erstellten Prognosen werden als Systemvorschläge bezeichnet.
- Im Rahmen des zweiten Schrittes werden die Systemvorschläge Experten zur Beurteilung vorgelegt (z. B. Beamten von Eurostat, die über Fachkenntnisse auf den jeweiligen Gebieten verfügen). Die Experten können anhand vorliegender Daten (z. B. aufgrund besonderer

Erhebungen, Fallstudien, Frühindikatoren für die Witterungsverhältnisse) oder anhand ihrer eigenen Beurteilung Verbesserungsvorschläge unterbreiten. Die Expertenvorschläge werden in das System eingearbeitet.

- Nach Berücksichtigung der Expertenvorschläge erstellt das Kurzfristmodell die endgültige Prognose im Rahmen der Definitionen der ABTA.

Aus den vorstehenden methodischen Anmerkungen dürfte klar werden, daß die wichtigsten Variablen für das Kurzfristmodell exogener Art sind. Endogen werden im Rahmen des SFSS nur diejenigen (begrenzten) Produkt- und Faktorsubstitutionen abgebildet, die kurzfristig möglich sind (z.B. zwischen verschiedenen Futtermittelkategorien).

2. Zusammenfassung der Ergebnisse

Die jüngsten agrarsektoralen Entwicklungen in der Europäischen Union werden maßgeblich von den Veränderungen der agrarpolitischen Rahmenbedingungen bestimmt, die mit der 1992 beschlossenen Reform der Gemeinsamen Agrarpolitik (GAP) eingetreten sind. Diese ist gekennzeichnet durch den ausgeprägten Rückgang der Stützungspreise, den Übergang zu einem stärker auf direkten, weniger produktionsgebundenen Subventionen basierenden System der Einkommensstützung sowie die Verstärkung der finanziellen Anreize zur Produktionsbegrenzung (Flächenstilllegung).

Vor diesem Hintergrund war für die Landwirtschaft der Europäischen Union in der 1. Hälfte der 90er Jahre eine im Vergleich zur 2. Hälfte der 80er Jahre positive Entwicklung der landwirtschaftlichen Einkommen zu beobachten: Die **reale Nettowertschöpfung (NWS) zu Faktorkosten je Jahresarbeitseinheit** in EUR 12 lag im Durchschnitt der Jahre 1990-1992 um etwa +10,3 % höher als im Zeitraum 1985-1989; diese positive Entwicklung des genannten Einkommensindicators konnte sich in der Implementierungsphase der Agrarreform (1993-1995) behaupten. Die Prognose für 1996 zeigt gegenüber 1995 einen Anstieg der realen NWS zu Faktorkosten je Jahresarbeitseinheit um +5,5 % auf EUR 12-Ebene (EUR 15: +5,2 %).

Der während der Implementierungsphase der GAP-Reform zu beobachtende Rückgang der nominalen Bruttowertschöpfung (BWS) zu Marktpreisen in EUR 12 um -9,9 Mrd. ECU wurde durch den Anstieg der Subventionen um nominal +14,0 Mrd. ECU ausgeglichen (1995 gegenüber dem Durchschnitt der Jahre 1990-92). Dennoch war in der 1. Hälfte der 90er Jahre ein Absinken der realen NWS zu Faktorkosten zu beobachten. Die positive Entwicklung der Realeinkommen je Jahresarbeitseinheit resultierte damit aus der fortgesetzten Reduzierung des Arbeitseinsatzes.

Den am stärksten von der GAP-Reform betroffenen Produktbereich bildeten die pflanzlichen Erzeugnisse. Ihr aggregierter Bruttoproduktionswert zu laufenden Preisen ist für EUR 12 in den Jahren 1992 und 1993 um -7,2 % und -9,4 % gesunken und in 1994 und 1995 um +3,5 % und +3,2 % angestiegen. Ausschlaggebend für diese Veränderungen waren vor allem die Preisbewegungen: so ist der durchschnittliche Unit value (Durchschnittspreis) in 1992 und 1993 um -8,9 % und -5,5 % gesunken, während er 1994 - vor allem bedingt durch den Anstieg bei den Kartoffelpreisen - um +4,7 % und in 1995 nochmals um +2,3 % angestiegen ist. Der für das Jahr 1996 prognostizierte Anstieg des Bruttoproduktionswertes der pflanzlichen Erzeugung zu laufenden Preisen ist ein Ergebnis des angestiegenen Produktionsvolumens.

In der tierischen Erzeugung fiel die Veränderung des Bruttoproduktionswertes zu laufenden Preisen moderater aus: +0,5 % in 1992, -3,1 % in 1993, +0,9 % in 1994 und -0,1 % in 1995. Der im Jahr 1996 zu verzeichnende Preisrückgang für Rindfleisch trägt zu dem Absinken des Bruttoproduktionswertes zu laufenden Preisen in der tierischen Erzeugung um -2,3 % bei.

Beim Vorleistungseinsatz zu laufenden Preisen ergaben sich leichte Einsparungen in den Jahren 1992 und 1993. Diese waren bei Düngemitteln mit -8,1 % in 1992 und -6,9 % in 1993 besonders stark ausgeprägt und sowohl auf Preis- als auch auf Volumentrükgänge zurückzuführen. In den Jahren 1994 und 1995 sind die Düngemittelkosten jedoch wieder um +6,2 % und +9,7 % angestiegen. Dieser Anstieg war sowohl durch höhere Preise für Düngemittel als auch durch das höhere Einsatzvolumen bedingt.

Einen näheren Einblick in die durch die Reform der GAP verursachten Veränderungen in der Produktion, im Vorleistungseinsatz und der Wertschöpfungsgrößen bietet die Betrachtung nach Produktionszweigen (Produktionsaktivitäten bzw. Gruppen von Produktionsaktivitäten), wie sie in Kapitel 4 dieser Veröffentlichung ausführlich vorgenommen wird. Im folgenden sind die Ergebnisse für die am stärksten betroffenen Produktionszweige der Landwirtschaft für EUR 12 zusammengefaßt:

- Bei **Getreide** ist die durchschnittliche BWS zu Marktpreisen je Hektar von rd. 460 ECU im Jahresdurchschnitt 1990-1992 auf rd. 300 ECU in 1995 gesunken. Addiert man jedoch die mit der GAP-Reform eingeführten Subventionen hinzu (Berechnung der "modifizierten BWS") so ergab sich bis 1995 ein Anstieg auf rd. 620 ECU je Hektar. Dies bedeutet eine Zunahme der hektarbezogenen modifizierten BWS um real +13,7 % gegenüber 1990-1992. Bei ansteigenden Hektarerträgen ist die Anbaufläche von 35,6 auf 32,6 Millionen ha gesunken.
- Bei **Hülsenfrüchten** wurde der Rückgang der hektarbezogenen BWS zu Marktpreisen zwischen dem Jahresdurchschnitt 1990-1992 und dem Jahr 1995 nicht in vollem Umfange durch die direkten Subventionen ausgeglichen. Die modifizierte BWS ist daher in diesem Zeitraum um real -42,1 % gesunken. Die Anbaufläche ist von 1,6 auf 1,8 Millionen ha angewachsen.
- Bei **Ölsaaten** erfolgte der Preiseinschnitt bereits im Jahr 1992 und verursachte einen erheblichen Rückgang der hektarbezogenen BWS zu Marktpreisen. Dieser Rückgang wird jedoch durch den Anstieg der direkten Subventionen ausgeglichen. Die Anbaufläche ist bei stabilen Hektarerträgen ab 1995 zurückgegangen.
- In der **Mast von männlichen Rindern und Kälbern** war bei schwankenden Durchschnittspreisen für Rindfleisch ein Anstieg der direkten Subventionen zu verzeichnen. Dies führte dazu, daß die modifizierte BWS je geschlachtetem Tier zwischen dem Jahresdurchschnitt 1990-1992 und dem Jahr 1995 um real +42,7 % angestiegen ist. Hierbei ist jedoch zu berücksichtigen, daß das Ergebnis stark von den jährlichen Schwankungen der Preise beeinflusst wird. Die Zahl der Schlachtungen ist im gleichen Zeitraum von 23,3 Millionen auf 19,4 Millionen Tiere zurückgegangen.

Abschließend bietet diese Veröffentlichung mit den Übersichten über den **hektarbezogenen Pflanzenschutzmittel- und Düngemittelleinsatz** (Kapitel 5) einen Anknüpfungspunkt für die Diskussion umweltrelevanter Aspekte der landwirtschaftlichen Produktion und der GAP-Reform. Hinsichtlich des Pflanzenschutzmitteleinsatzes läßt sich für EUR 12 zusammenfassend sagen, daß der hektarbezogene Umfang des Pflanzenschutzmitteleinsatzes seit 1994 wieder eine ansteigende Tendenz aufweist. Der Einsatz von Düngemitteln je Hektar Fläche ist nach dem Rückgang im ersten Jahr der Agrarreform (1993) während der weiteren Implementierungsphase der Reform wieder in etwa auf sein Ausgangsniveau angestiegen.

1. Introduction

1.1. Contents of the publication

This publication focuses on various aspects of agricultural sector developments during the period 1985-1996 in the European Union and its Member States⁵. The tables presented in this publication are computed from the SPEL/EU-Data (dated December 1996). The results for the **three new Member States** (Austria, Finland, Sweden) are likely to be subject to major revisions and have therefore to be considered as preliminary results. However, they have been used for this publication so that a more complete picture of the EU's agricultural sector can be considered.

The SPEL/EU-Data describe agricultural output generation and input use within the framework of an activity-based approach. They take into account the intersectoral output and input flow between agriculture and non-agriculture as well as the intrasectoral output and input flow between agricultural production activities. At the same time they also comprise information on agricultural gross value added at market prices broken down by production branches.

Chapter 1.2 explains the basic characteristics of the SPEL approach, while chapters 1.3 and 1.4 give short overviews of those modules of the SPEL System that have generated the SPEL/EU-Data: the Base System (BS) and the Short-term Forecast and Simulation System (SFSS)⁶.

Chapter 2 presents a summary analysis of sectoral trends in the European Union. It is based on the data presented in the tables of chapters 3 to 5.

Chapter 3 gives an overview of the development of the sectoral value-added components. It shows the change in gross output and intermediate consumption in terms of change rates of values, volumes and unit values differentiated by groups of product or input items.

Chapter 4 focuses on the main agricultural production activities or groups of production activities. It provides a picture of trends in output values, intermediate consumption and gross value added at market prices in the different production branches. The calculation of a "modified gross value added", which includes estimates of those subsidies introduced or affected by the 1992 reform of the Common Agricultural Policy⁷, supplements the information on value added.

Chapter 5 concludes the publication with the presentation of selected data on intermediate input use, which may be of interest in environmental questions. It focuses on plant protection and fertilizer input per hectare.

The tables in this publication have been computed by standardized exploitation routines for the SPEL/EU-Data. The SPEL/EU-Data show a much deeper differentiation with respect to production activities, product and input items than the tables presented in this publication. The whole set of SPEL/EU-Data for the period 1973-1996 is available in Eurostat's NewCronos databank.

⁵ The data refer to the territory of the European Union as before 1 January 1995 (EUR 12) and after 1 January 1995 (EUR 15). The results for Germany comprise the old Bundesländer up to 1990 and from 1991 onwards the old and new Bundesländer. Results at EUR 12 and EUR 15 level are arrived at by aggregation.

⁶ For detailed methodological notes, the reader is referred to "SPEL System - Methodological Documentation (Rev. 1) - Vol. 1: Basics, BS, SFSS" which has been published by Eurostat in January 1995.

⁷ Per-hectare compensatory payments for cereals, oilseeds and pulses, beef and suckler cow premiums, sheep and goats premiums

Additionally, it can be obtained by external users in the form of the "SPEL/EU data for agriculture on CD-ROM 1973-1996", which is available from the Office for Official Publications of the European Communities. Further information about SPEL is also available on the WWW-Server of the Commission "EUROPA" (<http://europa.eu.int/en/comm/eurostat/spel/homepage.htm>).

1.2. General characteristics of the SPEL approach

The SPEL System is designed for monitoring the present situation in the agricultural sector, for ex-post analyses of sectoral developments and for short-term and medium-term forecasts and policy simulations of the effects of alternative agricultural policies.

Common to all modules of SPEL is the activity-based accounting approach:

- The activity-based approach constitutes a division of the agricultural sector into production and use activities. It traces production interactions within the agricultural sector (intrasectoral flows) and between agriculture and non-agriculture (intersectoral flows).
- It provides a detailed breakdown of agricultural production and distinguishes between forty-nine production activities, sixty product items and thirty-three variable input items. Fifteen intrasectoral use activities and one intersectoral use activity (sales/purchases) complete the representation of product and input flows.
- The compliance with the accounting-approach guarantees consistency with respect to physical and monetary cyclical links, and ensures the comparability of data and model results with the definitions used in the Economic Accounts for Agriculture (EAA).

The approach described above results for each represented year and Member State in what is called an "Activity-based Table of Account (ABTA)"⁸. An ABTA provides a detailed breakdown of the agricultural production processes into yield and input coefficients as well as cultivated area and herd size. By also taking into account the important intrasectoral product flows between production activities and within single production activities (e.g. young animals or feedingstuffs), it presents approximately realistic gross output values. After the aggregation of the production activity data, the sum of the non-consolidated (gross) flows of SPEL is identical with the sum of the consolidated (net) flows of the EAA, which contains the final output value. The resulting sectoral gross value added at market prices of SPEL therefore complies with the definitions of the EAA.

An "Additional Demand Component" that depicts the flows of products from their origin to their final consumption supplements the supply-oriented ABTA. It breaks down the use of the raw (primary) agricultural products outside the agricultural sector into different use activities: human consumption, animal feed, seed use, industrial use, processing, stock changes, losses and exports. In addition, it links the supply-balance sheets of the raw products (e.g. rape seed) to the domestic resources of the processed products (e.g. rape oil) via "processing" activities.

A further important characteristic of the SPEL approach is that it does not take the set of statistical data as final. The identity systems of the modules of the SPEL/EU-model comprise several consistency checks. These are starting-points for critical investigations of the database, which are carried out in close co-operation between the model builders and the statisticians of Eurostat and the Member States.

⁸ The ABTAs for the European Union as a whole are calculated by an aggregation over the Member States' ABTAs.

1.3. Base System

The Base System generates the SPEL/EU-Data for the ex-post period (here the data up to 1995). For this, it combines different sources of information: official agricultural statistics (mainly from the databases of Eurostat), farm sample data, technical and management data.

However, the BS does not directly specify the ABTA and Additional Demand Component on the basis of these data. The shortcomings of statistical material make systematic data preparation work necessary (mainly completion of missing data).

Once the data preparation steps are completed, the Base Model (BM) integrates the different types of (prepared) data in order to constitute the ABTA and Additional Demand Component. It derives the sets of input and output coefficients, activity levels and input and output prices by recursive and iterative approaches. Well-defined identity systems and checking procedures ensure the consistency of the results.

The results of the Base System can be used for ex-post analyses of trends in output and intermediate consumption, productivities, prices and incomes. More importantly, however, the results of BS are the basis for short- and medium-term forecast and simulations.

1.4. Short-term Forecast and Simulation System

The Short-term Forecast and Simulation System has been used to generate the update of the SPEL/EU-Data for the year 1996.

In the update work, SFSS serves as a means of bridging the statistical gap between the current year and the statistical information available for the previous and current year. For example, the "routine" application of SFSS in the autumn of 1996 has generated the SPEL/EU-Data for 1996 (diagnosis of the current situation).

In addition, SFSS can also be applied to produce ex-ante projections and simulations for up to one year.

Projections, simulations and updates with SFSS are carried out in the framework of the ABTA. Normally the following worksteps are obeyed:

- Early available statistical data and trend-based econometric analyses for output coefficients, production activity levels, producer and purchase prices, market use activities and macroeconomic variables (exchange rates, GDP-deflator, etc) are the starting-points for short-term forecasts. The short-term model combines this information and produces consistent ABTAs. The EAA income components are the central resultant variables. The forecasts produced during this stage are called system proposals.
- The second step comprises judgements on the system proposals by specialists (e.g. by Eurostat officials with expertise in the relevant fields). The specialists can make suggestions for improvements on the basis of available data (e.g. from special surveys, case studies, early indicators for the weather conditions) or on the basis of their own assessments. These expert proposals are entered into the system.
- Once the expert proposals are taken into account, the short-term model produces the definitive forecast in the definitions of the ABTA.

From the above methodological remarks it should be clear that the most important variables are exogenous for the short-term model. Endogenously, SFSS depicts only those (limited) substitutions of products and factors which are feasible for the short-term (e.g. between different feed categories).

2. Summary of the results

Recent trends in the agricultural sector of the European Union have been inextricably intertwined with the changes in agricultural policy which were introduced following the decisions taken in 1992 to reform the Common Agricultural Policy (CAP). These CAP reform changes have essentially involved a marked reduction in support prices, the transition to an income support system based on subsidies that are more direct and less linked to production and on greater financial incentives for limiting production (set-aside).

An upward trend in agricultural income as measured by **real net value added (NVA) at factor cost per annual work unit** was observed for the European Union as a whole in the early 1990's; for EUR 12 it was on average about +10.3% higher in the period 1990-1992 than between 1985 and 1989. Against the background of policy changes, this higher level of real NVA at factor costs per annual work unit was maintained in the implementation phase of the CAP reform (1993 -1995). First estimates for 1996 suggest an average increase in this income indicator of +5.5 % at the EUR 12 level (EUR 15: +5,2 %) over the 1995 figure.

During the implementation phase of the CAP reform, the level of gross value added (GVA) at market prices for EUR 12 fell by -9.9 billion ECU in nominal terms (1995 compared to the average of the years 1990-1992). This was compensated for by the increase in subsidies of +14.0 billion ECU in nominal terms. Since there was a fall in NVA at factor cost during the first half of the 1990s when expressed in real terms, the positive trend in real incomes per annual work unit was therefore the result of the continued reduction in the volume of agricultural labour input.

Crop products were the most severely affected by the reform of the CAP. The aggregate gross output value at current prices for total crop products fell by -7.2 % and -9.4 % in 1992 and 1993 for EUR 12, although it rose by +3.5 % and +3.2 % in 1994 and 1995. The principal reason for these value changes was price movements; the average unit value for crop products as a whole fell by -8.9 % in 1992 and by -5.5 % in 1993, though it increased by +4.7 % in 1994, mainly as a result of the increase in potato prices. A further increase of the average unit value by +2.3 % has been recorded for 1995. The forecast increase for 1996 of the gross output value for total crops at current prices stems from the higher output volume.

The changes in the gross output value at current prices for total animal products were more moderate: +0.5 % in 1992, -3.1 % in 1993, +0.9 % in 1994 and -0.1 % in 1995. The severe fall in beef prices in 1996 contributed to the reduction in total animal output value at current prices of -2.3 %.

There was a slight fall in the value of intermediate consumption at current prices in the years 1992 and 1993. This was especially evident for fertilizers, which saw falls of -8.1 % in 1992 and -6.9 % in 1993, as a result of reductions in both prices and volumes. However, in 1994 and 1995 fertilizer costs rose by +6.2 % and +9.7 %. This increase was caused by higher prices and by an increase of the volume of fertilizers used in agricultural production.

Analyses of the individual production branches (production activities or groups of production activities), which are given in detail in chapter 4 of this publication, enable a better understanding of the changes in output, in the utilization of intermediate consumption items and in the aggregates of value-added, due to the reform of the CAP. A summary of the results for the agricultural production branches most affected at the EUR 12 level is given below.

- For **cereals**, the average GVA at market prices per hectare fell from around 460 ECU for the average of the years 1990-1992 to about 300 ECU in 1995. However, adding the subsidies introduced under the CAP reform (calculating the "modified GVA") led to an increase of about 620 ECU per hectare in 1995. This means that the modified GVA per hectare had increased by +13.7 % in real terms by 1995 in comparison to the average of the years 1990-1992. During the

same period, there was an increase in yields per hectare and the area under cultivation declined from 35.6 to 32.6 million ha.

- In the case of **pulses**, direct subsidies were not able to offset fully the fall in GVA at market prices per hectare. Between the average of the years 1990-1992 and the year 1995, modified GVA fell by -42.1 % in real terms. The area under cultivation rose from 1.6 to 1.8 million ha.
- For **oilseeds**, prices began to fall in 1992, leading to a considerable reduction in GVA at market prices per hectare. However, this fall was offset by the increase in direct subsidies. The area under cultivation fell in 1995 and is estimated to have done so in 1996, with yields per hectare being relatively stable.
- As regards **male adult cattle and calves for fattening**, there was an increase in direct subsidies together with fluctuating unit values for beef. This produced an increase of +42.7 % in real modified GVA per slaughtered animal between the average of the years 1990-1992 and the year 1995. However, it must be considered that the result is strongly influenced by the fluctuating unit values. The number of animals slaughtered declined in the same period from 23.3 million to 19.4 million head.

Lastly, the tables on the volumes of intermediate consumption used per hectare concerning **plant protection products and fertilizers**, which figure in chapter 5 of this publication, offer a starting point for a discussion of aspects of agricultural production and CAP reform that are important for the environment. In summary form, it is shown that the quantities of plant protection products used per hectare began increasing again for EUR 12 as a whole in 1994. The spread of fertilizers per hectare, after its sharp decline in the first year of the CAP reform (1993), has since increased back to the level before the CAP reform of 1992.

1. Introduction

1.1. Contenu de la publication

La présente publication est consacrée aux différents aspects de l'évolution du secteur agricole au cours de la période 1985-1996 dans l'Union européenne et dans ses Etats membres⁹. Les tableaux qui y sont présentés ont été établis à partir des données SPEL/UE (actualisation de décembre 1996). Les résultats pour **les trois nouveaux Etats membres** (Autriche, Finlande, Suède) sont encore soumis à des révisions importantes et doivent donc être considérés comme des résultats préliminaires. Cependant, ils ont été intégrés dans cette publication afin de fournir une image plus complète du secteur agricole de l'Union européenne.

Les données SPEL/UE décrivent la façon dont est générée la production agricole et dont sont utilisés les inputs dans le cadre d'une approche basée sur l'activité. Ces données tiennent compte de la production intersectorielle et du flux d'inputs entre le secteur agricole et le secteur non agricole ainsi que de la production intrasectorielle et du flux d'inputs entre les différentes activités de production agricole. En même temps, elles contiennent également des informations sur la valeur ajoutée brute de l'agriculture aux prix du marché ventilées par branches de production.

Le chapitre 1.2. présente les caractéristiques de base de l'approche SPEL tandis que les chapitres 1.3. et 1.4. donnent de brefs aperçus des modules du Système SPEL/UE qui ont fourni les données SPEL/UE: le système de base (BS) et le système de prévision et de simulation à court terme (SFSS)¹⁰.

Le chapitre 2 présente une analyse récapitulative des tendances sectorielles dans l'Union européenne. Cette analyse se fonde sur les données présentées dans les tableaux des chapitres 3 à 5.

Le chapitre 3 donne un tableau global de l'évolution des composantes de la valeur ajoutée sectorielle. Il souligne l'évolution de la production brute et de la consommation intermédiaire en termes de taux de variation des valeurs, des volumes et des valeurs unitaires différenciées par groupes de produits ou par inputs.

Le chapitre 4 concerne spécifiquement les principales activités de production ou groupes d'activités de production agricole. Il donne une image des tendances observées dans les valeurs de production, dans la consommation intermédiaire et dans la valeur ajoutée brute aux prix du marché dans les différentes branches de production. Le calcul d'une "valeur ajoutée brute modifiée", qui comprend des estimations des subventions introduites ou touchées par la réforme de la politique agricole commune de 1992¹¹, complète les informations sur la valeur ajoutée.

⁹ Les données se réfèrent au territoire de l'Union européenne avant le 1^{er} janvier 1995 (EUR 12) et après le 1^{er} janvier 1995 (EUR 15). Les résultats concernant l'Allemagne couvrent les anciens Länder jusqu'en 1990 et les anciens et les nouveaux Länder à partir de 1991. Les résultats pour EUR 12 et EUR 15 sont obtenus par agrégation

¹⁰ Pour de plus amples détails méthodologiques, le lecteur est invité à consulter le "Système SPEL - Documentation méthodologique (Rev.1) - Volume 1: Éléments de base, BS, SFSS" qui sera publié par Eurostat au printemps 1995.

¹¹ Versements compensatoires par hectare pour les céréales, les graines oléagineuses et les légumes secs, les primes pour la viande bovine et les vaches allaitantes, les primes pour les ovins et les caprins

Le chapitre 5 conclut la publication en présentant des données sélectionnées sur l'utilisation d'inputs intermédiaires qui peuvent présenter un intérêt en matière d'environnement. Il se concentre sur la protection des cultures et l'utilisation de fertilisants par hectare.

Les tableaux de cette publication ont été dressés à l'aide de programmes d'exploitation standardisés pour les données SPEL/UE. Ces données sont davantage différenciées en ce qui concerne les activités de production, les produits et les inputs que les tableaux présentés dans cette publication. La série complète de données SPEL/UE pour la période 1973-1996 est disponible dans la banque de données NewCRONOS d'Eurostat et peut être obtenue par les utilisateurs extérieurs sous le titre "Données SPEL/UE pour l'agriculture sur CD-ROM 1973-1996" auprès de l'Office des publications officielles des Communautés européennes. Des informations complémentaires sur SPEL sont également disponibles sur le site Internet de la Commission européenne "EUROPA" (<http://europa.eu.int/en/comm/eurostat/spel/homepage.htm>).

1.2. Caractéristiques générales de l'approche SPEL

Le rôle du Système SPEL est de contrôler la situation actuelle dans le secteur agricole, de permettre des analyses ex post des développements sectoriels, des prévisions à court et à moyen terme et des simulations politiques des effets de politiques agricoles différentes.

L'approche comptable basée sur l'activité est commune à tous les modules de SPEL:

- l'approche basée sur l'activité est une division du secteur agricole en activités de production et d'utilisation. Elle décrit les interactions de production dans le secteur agricole (flux intrasectoriels) et entre le secteur agricole et le secteur non agricole (flux intersectoriels);
- elle fournit une ventilation détaillée de la production agricole et fait une distinction entre 49 activités de production, 60 produits et 33 inputs variables. 15 activités d'utilisation intrasectorielle et une activité d'utilisation intersectorielle (ventes/achats) complètent la présentation des flux, des produits et d'inputs;
- la conformité avec l'approche comptable assure la cohérence eu égard aux liens physiques et monétaires cycliques ainsi que la comparabilité des données et des résultats du modèle avec les définitions utilisées dans les comptes économiques de l'agriculture (CEA).

L'approche décrite ci-dessus donne, pour chaque année représentée et pour chaque Etat membre de l'Union européenne, ce que l'on appelle un "tableau de répartition des comptes par activité (ABTA)"¹². Un ABTA fournit une ventilation détaillée des processus de production agricole en coefficients de rendement et d'input et en superficie cultivée ou taille du cheptel. En tenant compte également des flux importants de produits intrasectoriels entre les activités de production et dans le cadre des activités de production simples (par exemple jeune bétail ou aliments pour animaux), il contient des valeurs de production brutes à peu près réalistes. Après agrégation des données sur l'activité de production, la somme des flux non consolidés (bruts) de SPEL est identique à celle des flux consolidés (nets) des CEA contenant la valeur de la production finale. La valeur ajoutée brute sectorielle aux prix du marché de SPEL, qui en résulte, est donc conforme aux définitions des CEA.

Une "composante demande complémentaire", qui décrit les flux de produits depuis leur origine jusqu'à leur consommation finale, complète le ABTA orienté vers l'offre. Elle ventile l'utilisation des produits agricoles bruts (primaires) en dehors du secteur agricole en différentes activités d'utilisation: consommation humaine, alimentation animale, utilisation de semences, utilisation industrielle, traitement, variation des stocks, pertes et exportations. En outre, elle établit un lien entre les bilans d'approvisionnement de produits bruts (par exemple colza) et les ressources intérieures des produits transformés (par exemple huile de colza) par l'intermédiaire d'activités de "traitement".

¹² Les ABTA (Activity Based on Table of Accounts) pour l'ensemble de l'Union européenne sont calculés par agrégation des ABTA des États membres.

Autre caractéristique importante de l'approche SPEL: elle ne considère pas comme définitive la série de données statistiques. Les systèmes d'équations des modules du modèle SPEL/UE comprennent plusieurs contrôles de cohérence. Ces derniers constituent le point de départ d'études critiques de la base de données qui sont effectuées en étroite coopération entre les concepteurs du modèle et les statisticiens d'Eurostat et des Etats membres.

1.3. Système de base

Le système de base génère les données SPEL/UE pour la période ex post (dans ce cas, les données jusqu'en 1995). Pour ce faire, il combine différentes sources d'information: statistiques agricoles officielles (essentiellement celles des bases de données Eurostat), données tirées de sondages sur les exploitations agricoles, de données techniques et de gestion.

Toutefois, le BS ne spécifie pas directement le ABTA et la composante demande complémentaire sur la base de ces données. Les défauts du matériel statistique font qu'il est nécessaire de procéder à un travail systématique de préparation des données (essentiellement recherche des données manquantes).

Une fois les étapes de préparation des données achevées, le modèle de base (BM) intègre les différents types de données (préparées) afin d'établir le ABTA et la composante demande complémentaire. Il calcule les séries de coefficients d'input et d'output, les niveaux d'activité et les prix des inputs et des outputs à l'aide d'approches récursives et itératives. Des systèmes d'identité et des procédures de contrôle bien définis assurent la cohérence des résultats.

Les résultats du système de base peuvent être utilisés pour des analyses ex post de tendances dans la production, la productivité, les prix et les revenus. Mais plus important encore: les résultats du BS constituent la base de prévisions et de simulations à court et à moyen terme.

1.4. Système de prévision et de simulation à court terme

Le système de prévision et de simulation à court terme a été utilisé pour mettre à jour les données SPEL/UE pour l'année 1996.

Dans ce travail de mise à jour, le SFSS est utilisé pour combler les lacunes entre l'année en cours et l'information statistique disponible pour l'année précédente et l'année en cours. Par exemple, l'application de "routine" du SFSS à l'automne 1996 a fourni les données SPEL/UE pour 1996 (évaluation de la situation actuelle).

En outre, le SFSS peut également être appliqué pour produire des projections ex ante et des simulations jusqu'à un an.

Les projections, les simulations et les mises à jour à l'aide du SFSS sont effectuées dans le cadre du ABTA. Normalement, les étapes de travail sont les suivantes:

- des données statistiques disponibles très tôt et des analyses économétriques basées sur les tendances pour les coefficients d'output, les niveaux d'activité de production, les prix à la production et les prix d'achat, les activités d'utilisation du marché et les variables macro-économiques (taux de change, déflateur PIB, etc..) sont les points de départ de prévisions à court terme. Le modèle à court terme combine ces informations et fournit des ABTA cohérents. Les composantes du revenu CEA sont les variables principales qui en résultent. Les prévisions établies au cours de cette étape sont appelées des propositions du système;
- la seconde étape comprend des avis émis sur les propositions du système par des spécialistes (par exemple, par des fonctionnaires d'Eurostat spécialisés dans les domaines pertinents). Les spécialistes peuvent faire des suggestions d'amélioration sur la base de données disponibles (par exemple, à partir d'enquêtes spéciales, d'études de cas, d'indicateurs précoces pour les

conditions météorologiques) ou sur la base de leurs propres évaluations. Ces propositions d'expert sont incluses dans le système;

- une fois les propositions d'expert prises en compte, le modèle à court terme génère la prévision définitive selon les définitions du ABTA.

D'après les remarques méthodologiques ci-dessus, il est clair que les variables les plus importantes sont exogènes pour le modèle à court terme. Le SFSS ne décrit de façon endogène que les substitutions (limitées) de produits et de facteurs qui sont réalisables à court terme (par exemple, remplacement de certaines catégories de fourrage par d'autres).

2. Présentation récapitulative des résultats

Les évolutions les plus récentes dans le secteur agricole de l'Union européenne sont principalement déterminées par les changements dans la politique agricole intervenus après les décisions prises en 1992 pour réformer la politique agricole commune (PAC). Ces changements comportent essentiellement: une réduction marquée des prix de soutien, l'adoption d'un système d'aide au revenu davantage fondé sur des subventions directes et moins liées à la production et une incitation financière accrue à limiter la production (gel des terres).

Dans ce contexte, on observe qu'au cours de la première moitié des années 90, le revenu agricole a évolué de façon positive par rapport à la deuxième moitié des années 80: **la valeur ajoutée nette (VAN) réelle au coût des facteurs par unité de travail annuel** dans l'EUR 12 est, en moyenne des années 1990-1992, de 10,3% supérieure à ce qu'elle était entre 1985 et 1989. Cette tendance s'est maintenue dans la période de mise en oeuvre de la réforme de la PAC (1993-1995). Les prévisions pour 1996 montrent, par rapport à 1995, une augmentation de la VAN réelle au coût des facteurs par unité de travail annuel de +5,5% dans l'EUR 12 (EUR 15: +5,2%).

La diminution de 9,9 milliards d'écus de la valeur ajoutée brute nominale (VAB) aux prix du marché dans EUR 12 durant la phase de mise en oeuvre de la réforme de la PAC a été compensée par l'augmentation des subventions de +14,0 milliards d'écus en valeur nominale (1995 comparé à la moyenne des années 1990-1992). Cependant, en valeur réelle, il y avait un recul de la VAN au coût des facteurs au cours de la première moitié des années 90. L'évolution positive des revenus réels par unité de travail annuel était donc le résultat de la baisse continue du volume de la main-d'oeuvre agricole.

Le secteur de production le plus touché par la réforme de la PAC était celui des produits végétaux dont la valeur de production brute agrégée en prix courants a baissé, pour EUR 12, en 1992 et 1993 de -7,2 % et de -9,4 % et augmenté de +3,5 % et +3,2 % en 1994 et 1995. Ces variations sont avant tout dues aux mouvements des prix: ainsi, la valeur unitaire moyenne a baissé de -8,9 % en 1992 et de -5,5 % en 1993 tandis qu'en 1994 et 1995, elle a augmenté de +4,7 % et +2,3 % en raison surtout de la hausse des prix des pommes de terre. L'augmentation prévue de la valeur de production brute pour les produits végétaux en prix courants pour 1996 est le résultat de l'augmentation des volumes de production.

Dans le secteur de la production animale, la variation de la valeur de la production brute en prix courants a été plus modérée: +0,5 % en 1992, -3,1 % en 1993, +0,9 % en 1994 et -0,1 % en 1995. La chute du prix de la viande bovine en 1996 contribue à la diminution de la valeur de production en prix courants des produits animaux de -2,3 %.

Il y avait de légères réductions dans la valeur des consommations intermédiaires en prix courants en 1992 et 1993. Pour les engrais, après les chutes de: -8,1 % en 1992 et -6,9 % en 1993, suite aux réductions des prix et des volumes de production, les coûts ont réaugmentés de +6,2 % en 1994 et +9,7 % en 1995. Ces augmentations ont été causées par des prix plus élevés et par une augmentation des quantités d'engrais utilisés dans la production agricole.

L'analyse par branche de production (activités de production et groupes d'activités de production), telle qu'elle est effectuée de façon détaillée au chapitre 4 de cette publication, permet de mieux comprendre les variations, dues à la réforme de la PAC, de la production, de l'utilisation des consommations intermédiaires et des grandeurs de la valeur ajoutée. On trouvera, ci-après, une synthèse des résultats concernant les branches de production agricole les plus touchées de EUR12:

- Pour **les céréales**, la VAB moyenne aux prix du marché par hectare est tombée de 460 écus environ en moyenne des années 1990-1992 à 300 écus environ en 1995. Cependant, si on y ajoute les subventions introduites par la réforme de la PAC (calcul de la "VAB modifiée"), on

constate une augmentation de 620 écus environ par hectare jusqu'en 1995. Cela signifie que la VAB modifiée par hectare a augmenté de +13,7 % en valeur réelle par rapport à la moyenne des années 1990-1992. Les rendements par hectare ont augmenté et la superficie cultivée est passée de 35,6 à 32,6 millions d'hectares.

- Pour **les légumes secs**, la baisse de la VAB aux prix du marché par hectare n'a pas été totalement compensée par les subventions directes. Entre la moyenne des années 1990-1992 et l'année 1995, la VAB modifiée a baissé de -42,1 % en valeur réelle. La superficie cultivée est passée de 1,6 à 1,8 millions d'hectares.
- Pour **les graines oléagineuses**, la baisse des prix est intervenue dès 1992 et a entraîné un recul considérable de la VAB aux prix du marché par hectare. Toutefois, ce recul a été compensé par l'augmentation des subventions directes. La superficie cultivée a diminuée depuis 1995, les rendements par hectare sont restés stables.
- En ce qui concerne **l'engraissement des bovins et des veaux mâles**, on note une augmentation des subventions directes ainsi qu'une fluctuation des valeurs unitaires pour le boeuf. En conséquence, la VAB modifiée par animal abattu a augmenté de +42,7 % en valeur réelle entre la moyenne des années 1990-1992 et l'année 1995. Notons que ce résultat a été fortement influencé par la fluctuation des prix. Le nombre des abattages est passé, durant cette période, de 23,3 millions à 19,4 millions d'animaux..

Enfin, les tableaux sur les quantités des consommations intermédiaires par hectare au titre des moyens de **protection des cultures et des engrais**, qui figurent au chapitre 5 de cette publication, offrent une base de discussion des aspects relatifs à l'environnement de la production agricole et de la réforme de la PAC. En résumé, on constate que la quantité de produits phytopharmaceutiques utilisés par hectare a tendance depuis 1994 à augmenter de nouveau dans EUR 12. L'utilisation des engrais par hectare, après une baisse au cours de la première année de la PAC (1993), a augmenté pendant les autres années de mise en oeuvre de la réforme pour revenir à son niveau initial.

- 3. Sektorale Entwicklungen in der Europäischen Union und den Mitgliedstaaten**
- 3. Sectoral developments in the European Community and its Member States**
- 3. Développements sectoriels dans l'Union européenne et dans ses Etats membres**

3.1. Sektorale Wertschöpfung

3.1. Sectoral value-added

3.1. Valeur ajoutée sectorielle

Die folgenden Tabellen geben einen Überblick über die Entwicklung der landwirtschaftlichen Wertschöpfungskomponenten in der Europäischen Union insgesamt und in den einzelnen Mitgliedstaaten. Die Positionen reale Nettowertschöpfung zu Faktorkosten je Jahresarbeitseinheit und je Hektar werden dargestellt, da sie wichtige Indikatoren des landwirtschaftlichen Einkommens sind.

The following tables focus on the development of the agricultural value-added components in the European Union as a whole and in the Member States. The items real Net Value Added at factor cost per Annual Work Unit and per hectare are presented since they are important agricultural income indicators.

Les tableaux suivants concernent l'évolution des composantes de la valeur ajoutée de l'agriculture dans l'ensemble de l'Union européenne et dans les Etats membres. Les postes valeur ajoutée nette au coût des facteurs par unité de travail annuel et par hectare sont présentés car il s'agit d'indicateurs importants du revenu agricole.

3.2. Bruttonproduktion und Vorleistungseinsatz

3.2. Gross output and intermediate consumption

3.2. Production brute et consommation intermédiaire

In diesem Kapitel wird die Entwicklung der Produktionswerte und des Vorleistungseinsatzes im landwirtschaftlichen Produktionsbereich der Europäischen Union und ihrer Mitgliedstaaten dargestellt. Die Tabellen geben Aufschluß über die Veränderungen der Bruttoproduktion und des Vorleistungseinsatzes anhand der Veränderungsraten der Werte zu laufenden und konstanten Preisen und der entsprechenden "Unit Values" differenziert nach Gruppen von pflanzlichen Erzeugnissen, tierischen Erzeugnissen und Inputpositionen. Es ist festzuhalten, daß die Werte der Bruttoproduktion und des Vorleistungseinsatzes nicht nur die intersektoralen Output- und Inputströme zwischen dem landwirtschaftlichen Produktionsbereich und den nichtlandwirtschaftlichen Produktionsbereichen umfassen, sondern ebenfalls die intrasektoralen Ströme zwischen den verschiedenen landwirtschaftlichen Produktionsaktivitäten.

This chapter presents the development of output values and intermediate consumption in the agricultural branch of the European Union and its Member States. The tables show the changes in gross output and intermediate consumption in terms of annual change rates of values at current and constant prices and corresponding unit values differentiated according to groups of crop products, animal products and input items. It must be emphasized that the values of gross output and intermediate consumption comprise not only the intersectoral output and input flows between the agricultural branch and the non-agricultural branches but also the intrasectoral flows between the different agricultural production activities.

Ce chapitre présente l'évolution des valeurs de production et de la consommation intermédiaire dans la branche agricole de l'Union européenne et de ses Etats membres. Les tableaux indiquent les variations de la production brute et de la consommation intermédiaire en termes de taux de variation des valeurs en prix courants et en prix constants, des valeurs unitaires différenciées selon les groupes de produits végétaux, de produits animaux et d'inputs. Notons que les valeurs de la production brute et de la consommation intermédiaire comprennent non seulement la production intersectorielle et les flux d'inputs entre la branche agricole et les branches non agricoles mais également les flux intrasectoriels entre les différentes activités de production agricole.

4. Produktion, Vorleistungseinsatz und Wertschöpfung nach Produktionsaktivitäten in der Europäischen Union und ihren Mitgliedstaaten

4. Output, intermediate consumption and value-added by production activities in the European Union and its Member States

4. Production, consommation intermédiaire et valeur ajoutée par activité de production dans l'Union européenne et ses Etats membres

Die Tabellen in diesem Kapitel enthalten landwirtschaftliche Einkommensgrößen nach Produktionsaktivitäten oder Gruppen von Produktionsaktivitäten. Sowohl die Bruttoproduktion, die alle Outputpositionen der jeweiligen Aktivitätsgruppe beinhaltet (Haupt- und Nebenprodukte), als auch die Produktionskosten, die alle von der Aktivitätsgruppe eingesetzten Vorleistungspositionen umfassen, werden in Relation zur physischen Produktion (z. B. pro 1 000 kg) gesetzt. Darüber hinaus werden die Bruttoproduktion des Hauptprodukts und der Einsatz von Düngemitteln und Futtermitteln näher beleuchtet. Ferner werden die Bruttowertschöpfung zu Marktpreisen und die "modifizierte Bruttowertschöpfung" angegeben. Die Berechnung einer "modifizierten Bruttowertschöpfung", die Schätzungen der Subventionen im Zusammenhang mit der 1992 beschlossenen Reform der Gemeinsamen Agrarpolitik umfaßt (Ausgleichszahlungen je Hektar für Getreide, Ölsaaten und Eiweißpflanzen, Prämie für männliche Rinder und Mutterkühe, Schaf- und Ziegenprämie), ergänzt die Daten über die Wertschöpfung. Beide Einkommensindikatoren werden im Hinblick auf die physische Produktion und pro Einheit der Produktionsaktivität dargestellt. Ferner geben die Tabellen anhand der Outputkoeffizienten und Umfänge (Fläche oder Viehbestand) der Produktionsaktivitätsgruppen Aufschluß über die Entwicklung der physischen Produktion.

The tables of this chapter contain agricultural income measurements by production activities or groups of production activities. Both, gross output, which includes all the output items of the reviewed activity group (main and joint products), and the costs of production, which include all the intermediate input items used by the activity group, are reviewed in relation to physical production (e.g. per 1 000 kg). As a more detailed perspective the gross output of the main product and the intermediate consumption of fertilizer and animal feed are presented. Furthermore, the gross value added at market prices and the "modified gross value added" are shown. The calculation of a "modified gross value added", which includes estimates of those subsidies that are linked to the 1992 reform of the Common Agricultural Policy (per-hectare compensatory payments for cereals, oilseeds and pulses, beef and suckler cow premiums, sheep and goat premiums), supplements the information on the value added. Both income indicators are presented in relation to the physical output and per unit of production activity. In addition, the tables also show the development of the physical output in terms of output coefficients and levels (area or herd size) of the production activity groups.

Les tableaux de ce chapitre contiennent des mesures du revenu agricole par activité de production ou groupes d'activités de production. La production brute, qui comprend tous les postes d'output du groupe d'activité revu (produits principaux et annexes), et les coûts de production, qui incluent tous les postes de la consommation intermédiaire utilisés par le groupe d'activité, sont revus par rapport à la production physique (par exemple, par 1 000 kg). Afin d'avoir un aperçu plus détaillé, la production brute du produit principal et la consommation intermédiaire d'engrais et d'aliments pour animaux sont présentées. La valeur ajoutée brute aux prix du marché et la "valeur ajoutée brute modifiée" sont également indiquées. Le calcul d'une "valeur ajoutée brute modifiée", qui inclut les estimations des subventions liées à la réforme de la politique agricole commune de 1992 (versements compensatoires par hectare pour les céréales, les graines oléagineuses et les légumes secs, primes pour la viande bovine et les vaches allaitantes, primes pour les ovins et les caprins), complète l'information sur la valeur ajoutée. Les deux indicateurs du revenu sont présentés par rapport au volume de production physique et par unité d'activité de production. En outre, les tableaux montrent également l'évolution de la production physique en termes des coefficients d'output et les niveaux (superficie et taille du cheptel) des groupes d'activité de production.

Die Tabellen in diesem Kapitel geben Aufschluß über die Entwicklungen hinsichtlich der Intensität des Einsatzes mineralischer Düngemittel und Pflanzenschutzmittel pro Hektar landwirtschaftlicher Fläche insgesamt, Ackerland (weiter untergliedert nach Getreide und sonstigen pflanzlichen Erzeugnissen), Dauerkulturen und Grünland.

The tables in this chapter show the developments of the intensity of mineral fertilizer use as well as that of plant protection products per hectare of total agricultural area, arable land (further divided into cereals and other crops), permanent crops and grassland.

Les tableaux de ce chapitre présentent les évolutions de l'intensité d'utilisation d'engrais minéraux ainsi que de celle des produits phytosanitaires par hectare de superficie agricole totale, de terres arables (subdivisées en céréales et autres cultures), de cultures permanentes et de prairies et pâturages.

Die vorliegende Veröffentlichung behandelt verschiedene Aspekte von Entwicklungen im landwirtschaftlichen Sektor, die zwischen 1985 und 1996 in der Europäischen Union (EUR 15) und ihren Mitgliedstaaten eingetreten sind: 1. Sie bietet eine Übersicht über die Entwicklung der sektoralen Wertschöpfungskomponenten und die Änderung der Bruttoproduktion sowie des Vorleistungseinsatzes differenziert nach Produktgruppen oder Inputpositionen. 2. Es werden die Entwicklungen von Produktionswerten, Vorleistungseinsatz und Wertschöpfungen in den einzelnen Produktionszweigen dargestellt. Dabei werden auch diejenigen Subventionen berücksichtigt, die im Rahmen der 1992 beschlossenen Reform der Gemeinsamen Agrarpolitik eingeführt worden sind. 3. Es werden Daten über Pflanzenschutz- und Düngemittleinsatz pro Hektar vorgestellt.

The publication focuses on various aspects of agricultural sector developments during the period 1985 to 1996 in the European Union (EUR 15) and its Member States. 1. It gives an overview of the development of the aggregates of value added and shows the changes in gross output and intermediate consumption by groups or input items. 2. It provides a picture of trends in output values, intermediate consumption and value added in the different production branches. Those subsidies that were introduced by the 1992 reform of the common agricultural policy are also included. 3. It presents data on plant protection and fertilizer input per hectare.

La présente publication est consacrée aux différents aspects de l'évolution du secteur agricole au cours de la période 1985-1996 dans l'Union européenne (EUR 15) et dans ses États membres: 1) elle donne un tableau global de l'évolution des composantes intermédiaires différenciées par groupes de produits ou par *input*; 2) elle donne une image des tendances observées dans les valeurs de production, dans la consommation intermédiaire et dans la valeur ajoutée dans les différentes branches de production, comprenant des estimations des subventions qui ont été introduites par la réforme de la politique agricole commune de 1992; 3) elle présente des données sur la protection des cultures et l'utilisation de fertilisants par hectare.
