Eurostat hat die Aufgabe, den Informationsbedarf der Kommission und aller am Aufbau des Binnenmarktes Beteiligten mit Hilfe des europäischen statistischen Systems zu decken.

Um der Öffentlichkeit die große Menge an verfügbaren Daten zugänglich zu machen und Benutzern die Orientierung zu erleichtern, werden zwei Arten von Publikationen angeboten: Statistische Dokumente und Veröffentlichungen.

Statistische Dokumente sind für den Fachmann konzipiert und enthalten das ausführliche Datenmaterial: Bezugsdaten, bei denen die Konzepte allgemein bekannt, standardisiert und wissenschaftlich fundiert sind. Diese Daten werden in einer sehr tiefen Gliederung dargeboten. Die Statistischen Dokumente wenden sich an Fachleute, die in der Lage sind, selbständig die benötigten Daten aus der Fülle des dargebotenen Materials auszuwählen. Diese Daten sind in gedruckter Form und/oder auf Diskette, Magnetband, CD-ROM verfügbar. Statistische Dokumente unterscheiden sich auch optisch von anderen Veröffentlichungen durch den mit einer stilisierten Graphik versehenen weißen Einband.

Die zweite Publikationsart, die Veröffentlichungen, wenden sich an eine ganz bestimmte Zielgruppe, wie zum Beispiel an den Bildungsbereich oder an Entscheidungsträger in Politik und Verwaltung. Sie enthalten ausgewählte und auf die Bedürfnisse einer Zielgruppe abgestellte und kommentierte Informationen. Eurostat übernimmt hier also eine Art Beraterrolle.

Für einen breiteren Benutzerkreis gibt Eurostat Jahrbücher und periodische Veröffentlichungen heraus. Diese enthalten statistische Ergebnisse für eine erste Analyse sowie Hinweise auf weiteres Datenmaterial für vertiefende Untersuchungen. Diese Veröffentlichungen werden in gedruckter Form und in Datenbanken angeboten, die in Menütechnik zugänglich sind.

Um Benutzern die Datensuche zu erleichtern, hat Eurostat Themenkreise, d. h. eine Untergliederung nach Sachgebieten, eingeführt. Daneben sind sowohl die Statistischen Dokumente als auch die Veröffentlichungen in bestimmte Reihen, wie zum Beispiel „Jahrbücher“, „Konjunktur“, „Methoden“, untergliedert, um den Zugriff auf die statistischen Informationen zu erleichtern.

Y. Franchet
Generaldirektor

It is Eurostat's responsibility to use the European statistical system to meet the requirements of the Commission and all parties involved in the development of the single market.

To ensure that the vast quantity of accessible data is made widely available, and to help each user make proper use of this information, Eurostat has set up two main categories of document: statistical documents and publications.

The statistical document is aimed at specialists and provides the most complete sets of data: reference data where the methodology is well established, standardized, uniform and scientific. These data are presented in great detail. The statistical document is intended for experts who are capable of using their own means to seek out what they require. The information is provided on paper and/or on diskette, magnetic tape, CD-ROM. The white cover sheet bears a stylized motif which distinguishes the statistical document from other publications.

The publications proper tend to be compiled for a well-defined and targeted public, such as educational circles or political and administrative decision-makers. The information in these documents is selected, sorted and annotated to suit the target public. In this instance, therefore, Eurostat works in an advisory capacity.

Where the readership is wider and less well defined, Eurostat provides the information required for an initial analysis, such as yearbooks and periodicals which contain data permitting more in-depth studies. These publications are available on paper or in Videotext databases.

To help the user focus his research, Eurostat has created 'themes' i.e. a subject classification. The statistical documents and publications are listed by series, e.g. yearbooks, short-term trends or methodology, in order to facilitate access to the statistical data.

Y. Franchet
Director-General

Pour établir, évaluer ou apprécier les différentes politiques communautaires, la Commission des Communautés européennes a besoin d'informations.

Eurostat a pour mission, à travers le système statistique européen, de répondre aux besoins de la Commission et de l'ensemble des personnes impliquées dans le développement du marché unique.

Pour mettre à la disposition de tous l'importante quantité de données accessibles et faire en sorte que chacun puisse s'orienter correctement dans cet ensemble, deux grandes catégories de documents ont été créées: les documents statistiques et les publications.

Le document statistique s'adresse aux spécialistes. Il fournit les données les plus complètes: données de référence où la méthodologie est bien connue, standardisée, normalisée et scientifique. Ces données sont présentées à un niveau très détaillé. Le document statistique est destiné aux experts capables de rechercher, par leurs propres moyens, les données requises. Les informations sont alors disponibles sur papier et/ou sur disquette, bande magnétique, CD-ROM. La couverture blanche ornée d'un graphisme stylisé démarque le document statistique des autres publications.

Les publications proprement dites peuvent, elles, être réalisées pour un public bien déterminé, ciblé, par exemple l'enseignement ou les décideurs politiques ou administratifs. Des informations sélectionnées, triées et commentées en fonction de ce public lui sont apportées. Eurostat joue, dès lors, le rôle de conseiller.

Dans le cas d'un public plus large, moins défini, Eurostat procure des éléments nécessaires à une première analyse, les annuaires et les périodiques, dans lesquels figurent les renseignements adéquats pour approfondir l'étude. Ces publications sont présentées sur papier ou dans des banques de données de type vidéotex.

Pour aider l'utilisateur à s'orienter dans ses recherches, Eurostat a créé les thèmes, c'est-à-dire une classification par sujet. Les documents statistiques et les publications sont répertoriés par série — par exemple, annuaire, conjoncture, méthodologie — afin de faciliter l'accès aux informations statistiques.

Preliminary remarks

The contents of the SPEL/EU Data are in the public domain and as such are available to everyone. Direct on-line consultation, however, is currently restricted to the services of the Commission. All others wishing to obtain the SPEL/EU Data are invited to contact the Eurostat Information Bureau in Luxembourg. At the present time, the SPEL/EU Data is available on diskettes (3^{1/2}") for use on PC (or compatibles) together with a software package (CUB.X for Windows). This document is designed to serve as a brief outline guide for the SPEL/EU Data.

1. INTRODUCTION

The starting signal for the development of the SPEL System was the request by the European Commission (DG "Agriculture") for up-to-date information on the current situation and short-term development of agricultural income in the EU-Member States and the EU as a whole. To meet with this demand, the Statistical Office of the European Union (Eurostat) took the decision for the development of an appropriate agricultural model. After a short review and testing of the agricultural statistics it became immediately clear that, intensive work on the data base was necessary to ensure sufficient comparability between the EU Member States and consistency between the different domains of statistics.

Therefore, the first few years' work had to be invested in the design of a concept for an *integrated data system* and its piecemeal realization. This work started in 1980 at Bonn University (Germany) in close collaboration with Eurostat under the project title "Sektorales Produktions- und Einkommensmodell der Landwirtschaft (SPEL)".

The work on the database has resulted in the **Base System (SPEL/EU-BS)**¹ which combines different sources of data and produces a differentiated ex-post presentation of production, output use and income generation in the agricultural sectors of the EU Member States, which is consistent, in its totals, with the Economic Accounts for Agriculture (EAA). The SPEL/EU Data for the last available year are computed by the Short-term Forecast and Simulation System (SPEL/EU-SFSS).

At present the SPEL/EU Data comprise the agricultural sectors of 12 EU Member States and of EUR 12 as a whole. Complete time series of the whole system have been established back to the year 1973. Continuous updates of this integrated and consistent data set are performed by Eurostat.

The authors of the SPEL System are W. Henrichsmeyer, W. Wolf and H.J. Greuel from Bonn University (Institut für Agrarpolitik, Marktforschung und Wirtschaftssoziologie). The model first became operational in 1984, since when the model system and its database have been transferred to the AMDAHL computer of the European Commission in Luxembourg. The SPEL/EU Data has now been made available, not only for the services of the Commission but also for third parties.

Eurostat, Division F-1 ("Agricultural accounts and structures") is responsible for the SPEL/EU Data, its updating and the entire SPEL System in the European Commission.

2. SPEL/EU DATA-UTILISATION ON PC'S

The SPEL/EU Data are distributed using the DFT format. This format is used within Eurostat to disseminate multi-dimensional matrices.

The program CUB.X for Windows, which is shipped, can be used on a standard PC and enables the access to the SPEL/EU Data in DFT format. For more information, please contact the Eurostat Information Office (DG34/A-2, Tel: +352-4301-37267)

The data are structured in accordance with the dimensions defined in SPEL (regions, years etc.). For the presentation of data, CUB.X for Windows allows the user to arbitrarily arrange the dimensions. Furthermore, there is the possibility to select an external output format to save a specific data preparation, in order to transfer the data to commonly used PC software (spreadsheets like Excel, databases etc.).

The CUB.X for Windows Installation Guide should accompany the data diskettes.

3. THE SPEL/EU-MODEL

3.1. Aims and concept

The *main aims* of the SPEL System can be summarized as follows:

- checking of the consistency of Eurostat's agricultural statistics,
- monitoring and diagnosis of the current situation of the agricultural sectors in the EU Member States,
- ex-post analyses of sectoral developments,
- forecasts and policy simulations for the short and medium terms.

The methodological concept of the SPEL/EU-Model is based on experience from different types of agricultural sector modelling. But while most modelling work is concerned with methodological experimentation and academic exercises, the mandate of SPEL was to establish a modelling system for the purposes of the EU administration, which was to be implemented at Eurostat in Luxembourg.

These requirements have largely influenced the basic concept and structure of the SPEL System; it is designed as a tool for policy-oriented analyses, forecasts and simulations, which can be used in dialogues with policy-makers and administrators.

The SPEL approach is characterized by mutual interaction between model-builders and statisticians or policy-makers. The set of statistical data is not taken as final but subjected to consistency checks and critical investigations, which may lead to jointly agreed revisions of existing statistics, and proposals for amendments and conceptual changes for new statistics. It is not assumed either that policy-makers are able to specify target variables before they have a closer look at the problems involved. Instead, the fundamental idea is that the target priorities emerge during the process of policy dialogue on trade-offs between target variables.

This basic approach constitutes the main orientation for the design of the SPEL System. Some general features can be characterized by the terms:

- *modular approach*:
division of models into separate components which can be freely combined, in order to facilitate the division of labour and contribute to transparency,
- *activity-based approach*:
division of the agricultural sector into activities, to allow consideration of specific technological features of agricultural production and interdependence between the different crop and animal production activities,
- *consistency accounting framework*:
to balance physical and monetary flows,
- *transparency*:
this means that each element of the different model versions can be traced back to the original data sources and the underlying assumptions,
- *flexible user interface*:
to facilitate the dialogue between the model and policy-makers.

In order to accommodate these features, the SPEL System has rather simple, recursive structures within and between its different components.

3.2. Synopsis of the SPEL/EU-Model

In its modular design, the SPEL/EU-Model² consists of the following interrelated parts:

- Base System (BS),
- Short-term Forecast and Simulation System (SFSS),
- Medium-term Forecast and Simulation System (MFSS).

A short methodological overview of the BS and SFSS, which are used to generate the SPEL/EU Data for the ex-post period, is given below.

3.2.1. Base System (SPEL/EU-BS)

The design of the BS³ is characterized by two basic features:

- a consistent accounting framework,
- an activity-based approach.

The *accounting framework* follows the principles of the National Economic Accounts and the Economic Accounts for Agriculture (EAA). This ensures consistency with respect to physical and monetary flows, as well as comparability on the basis of EAA definitions. The closed accounting framework allows consistency checks and the derivation of "residual data", as a result of balancing calculations if all other data of a balancing equation are known.

The *activity-based approach* is the most important characteristic of the SPEL/EU-Model, because it depicts characteristic features of the agricultural production process (yields, production area etc.) and the interdependence between the different production activities. Intrasectoral flows between production activities can be included (gross flows), whereas the EAA only contains the intersectoral flows (net flows). However after the aggregation of all the production activities in the agricultural sector, the sum of the non-consolidated (gross) flows of SPEL is identical with the sum of the consolidated (net) flows of the EAA. The resulting sectoral value added of SPEL therefore comply with the definitions of the EAA.

The combination of both aspects and the distinction of production activities⁴ within the framework of the accounting system, leads to the "*Activity Based Table of Accounts*" (ABTA). The structure of the ABTA is illustrated by Figure 1.

At first glance the general presentation of the ABTA looks rather complicated because output, inputs and activities have to be considered simultaneously. If each production activity produced just one output, the model structure (and the notation) would be much simpler. The ABTA could then be presented with the same structure as a conventional input-output table.

² For more information, see Eurostat: SPEL System, Overview of the SPEL-System, Brussels, Luxembourg 1992

³ see Eurostat: SPEL System, Methodological Documentation (Rev. 1), Vol. 1: Basics, BS, SFSS, Part 2: Base System, Brussels, Luxembourg 1995

⁴ The distinction of production activities, agricultural products and input item are listed in chapter 2.4. of this document.

The structure of the ABTA, presented in Figure 1, has to be read as follows:

- the columns of the table present the output generation and input use of production activities, as well as different types of "use activities",
- the rows present output balances or input balances.

All variables are defined in value terms: e.g. XG_{ij} presents the quantity of output j , produced by production activity i , which is multiplied by the average producer price, PG_j , to arrive at the corresponding value of production.

Figure 1: Activity Based Table of Accounts

	Output activities		Use activities	
Output balances	$\sum_i \sum_j XG_{i,j} PG_j$	+	$\left(- \sum_k \sum_j XU_{k,j} PU_{k,j} \right)$	= 0

Input balances	$\left(- \sum_i \sum_h YU_{i,h} QU_h \right)$	+	$\sum_k \sum_h YG_{k,h} QG_{k,h}$	= 0
	=		=	
	0		0	

where :

- XG : Output Generation, ABTA, physical component,
- XU : Output Use, ABTA, physical component,
- YG : Input Generation, ABTA, physical component,
- YU : Input Use, ABTA, physical component,
- PG : Unit value producer prices for Output Generation,
- PU : Producer prices for Output Use,
- QG : Purchase prices for Input Generation,
- QU : Unit value purchase prices for Input Use,
- i : Subscript, production activities, ABTA, ($i = (1, \dots, n)$),
- j : Subscript, products, ABTA, ($j = (1, \dots, m)$),
- k : Subscript, use activities, ABTA, ($k = (n+1, \dots, N)$),
- h : Subscript, input items, ABTA, ($h = (m+1, \dots, M)$).

Interpretation of different aspects of the ABTA

The content of the different aspects of the ABTA can be interpreted as follows.

- In the upper section *the rows of the ABTA* show the output generation of the different production activities and its use for the different purposes: *intrasectoral uses* (seed, animal feed, calves etc., stock changes on farms, human consumption on farms), and *intersectoral uses* (sales). The intersectoral sales are further subdivided, according to an additional "demand component", into subgroups (processing, industrial use, human consumption, changes of stocks, losses). The sum of the generated values of outputs has to be equal to the sum of the values of uses for each individual product and all products as a whole.

Correspondingly in the lower section, the rows of the ABTA present the generation of inputs (within the agricultural sector and purchases from other sectors) and their uses in agricultural production processes.

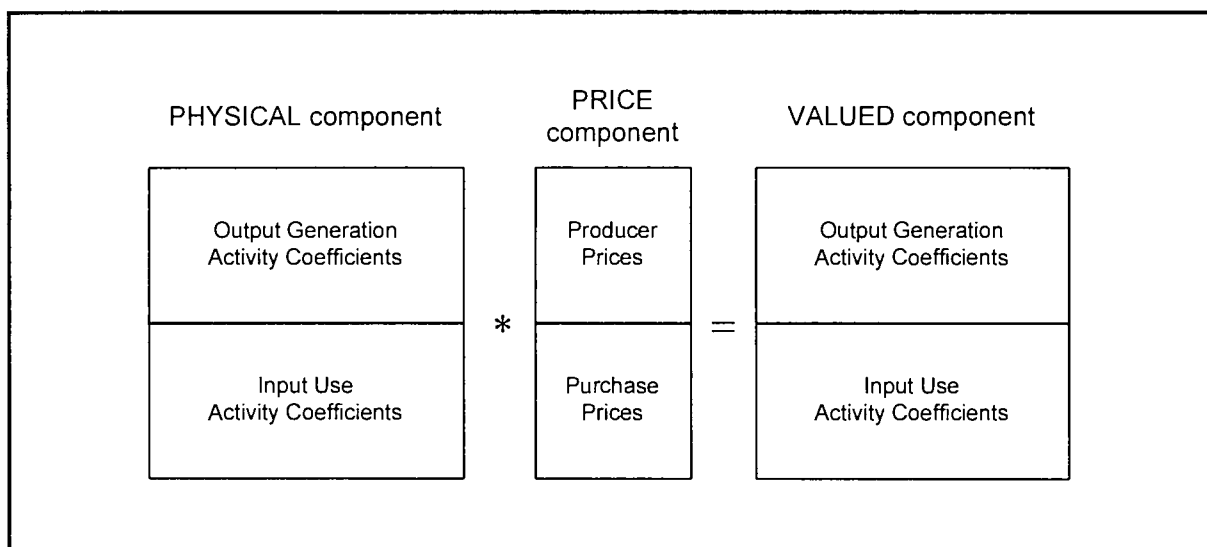

- The *columns of the ABTA* show the gross production value, the value of intermediate inputs and, as a residual, the gross value added at market prices for different production activities and, after aggregation, for the agricultural sector as a whole.

Monetary and physical components of the ABTA

Since most agricultural products and some inputs are fairly homogeneous they can be measured in physical units (tons). Therefore, it makes sense to establish the output and input balances of the ABTA in physical terms as well. The content of the output balances is then similar to that of the "Supply Balance Sheets" (as published by Eurostat).

If both the physical and valued components of the ABTA are established, it is possible to derive a set of average producer and purchase prices (unit values) by dividing the value variables by the corresponding physical quantity variables. The relationship between these physical and valued components is schematically shown in Figure 2.

Figure 2: Schematic representation of the Activity-Based Table of Accounts

The possibility of reverting to physical input and output balances and relationships is of crucial importance for the empirical specification of the Base System and for the Short-term Forecast and Simulation System. With regard to the specification of the ABTA, it is of special importance that it should allow the incorporation of various types of quantity data, technical information and experts judgment, and that detailed plausibility and consistency checks are possible.

A more precise look at agricultural production activities

So far, production activities have been mentioned only in rather general terms as output units. For a more precise look at the characteristics of agricultural production, it is helpful to distinguish between crop and animal production activities.

In *crop production*, activities are defined per unit of production area (hectare). The output and input coefficients of the production activities can then be determined by dividing the output and input values or quantities by the level (number of hectare) of the production activity.

In *animal production*, activities are defined per animal unit (head), and output and input coefficients can be derived accordingly.

In accordance with the definitions given in Figure 1, the coefficients can be defined as:

$$\text{Output coefficients: } XMG_{i,j} = \frac{XG_{i,j}}{LEVL_i}$$

$$\text{Input coefficients: } YMU_{i,h} = \frac{YU_{i,h}}{LEVL_i}$$

where : XMG : Output Generation, MAC, physical component,
 XG : Output Generation, ABTA, physical component,
 LEVL : Production activity level,
 PG : Unit value, producer prices for Output Generation,
 YMU : Input Use, MAC, physical component,
 YU : Input Use, ABTA, physical component,
 i : Subscript, production activities, ABTA, ($i = (1, \dots, n)$),
 j : Subscript, products, ABTA, ($j = (1, \dots, m)$),
 h : Subscript, input items, ABTA, ($h = (m+1, \dots, M)$).

On the basis of these definitions, output and input quantities of the ABTA can be traced back to output and input coefficients and activity levels:

$$\text{output: } XG_{i,j} = XMG_{i,j} LEVL_i$$

$$\text{input: } YU_{i,h} = YMU_{i,h} LEVL_i$$

This makes it possible, for example, to explain the development of plant production by both yield and acreage development, which is especially important for forecasts and policy simulations.

The whole set of output and input coefficients is called the "**Matrix of Activity Coefficients**" (**MAC**). It can be derived from the above equation system of the ABTA (Figure 1) by dividing the output and input quantities by the activity levels:

$$\sum_i \sum_j XMG_{i,j} PG_j - \sum_i \sum_h YMU_{i,h} QU_h = 0$$

$$\text{with: } XMG_{i,j} = \frac{XG_{i,j}}{LEVL_i}$$

$$YMU_{i,h} = \frac{YU_{i,h}}{LEVL_i}$$

where : XMG : Output Generation, MAC, physical component,
 XG : Output Generation, ABTA, physical component,
 LEVL : Production activity level,
 PG : Unit value, producer prices for Output Generation,
 YMU : Input Use, MAC, physical component,
 YU : Input Use, ABTA, physical component,
 QU : Unit value purchase prices for Input Use,
 i : Subscript, production activity, ABTA, (i = (1, ..., n)),
 j : Subscript, products, ABTA, (j = (1, ..., m)),
 h : Subscript, input items, ABTA, (h = (m+1, ..., M)).

Some remarks to SPEL/EU Data

A precondition for any modelling work is adequate preparation of the data base. Because of the well-known deficiencies of statistical material, intensive preliminary treatment of original statistics is necessary. This is especially true for the SPEL/EU-BS, for which a broad range of statistical material from the Member States had to be put into a consistent format, and for which the aim was to establish continuous time series for all variables from 1973 onwards. Therefore it has to be stressed that the data preparation for SPEL/EU-BS was (and still is) a considerable task.

A complete set of time series of the SPEL/EU Data is available for 12 EU Member States and for EUR 12 for the period from 1973 onwards.

Several times a year, the SPEL/EU Data is updated to incorporate any new statistical information which has become available. Experience from recent years has shown that most of the (preliminary) statistical material for the past one or two years is subsequently revised by the statistical offices in the Member States. Individual time series, however, are sometimes revised retrospectively for the entire ex-post period.

Consequently, the data for the entire ex-post period are always included in the updating carried out at least twice a year (in spring and autumn). In the spring, the main item is the new available data for the animal sector. In the autumn, the new and often revised data in the Economic Accounts for Agriculture (EAA) and the crop production data constitute the main task.

All this SPEL/EU Data updating work is carried out by Eurostat.

Further, it should also be mentioned in this context that apart from these updating procedures with the SPEL/EU-BS, the SPEL/EU-SFSS is used to update the SPEL/EU Data up to the current year, on the basis of preliminary statistical information and trend forecasts. This type of "updating" will be dealt with in the next chapter.

3.2.2. Short-term Forecast and Simulation System (SPEL/EU-SFSS)

The aims of SFSS⁵ are

- to "update" the system on the basis of currently available information (to bridge the statistical time-lag), and
- to produce forecasts and policy simulations up to one (or a maximum of two) year(s) ahead.

The central hypothesis of the short-term model is that the major decisions on the initiation of the production process and the allocation of production factors have already been made. The production process can then be viewed as being "in the pipeline" so that most output and input variables can be forecast exogenously. Only those (limited) substitutions between products and factors which are feasible within a short time (e.g. substitutions between different feed categories) are explained endogenously by model mechanisms.

The short-term forecasts and simulations are based on:

- econometric trend analyses of all the input and output coefficients, process levels and input and output prices of SPEL/EU Data,
- forecasts of exogenous trends by specialists (e.g. Eurostat officials working in various areas of statistics, and officials from the marketing divisions of the European Commission's Directorate-General VI),
- information on policy-determined variables and parameters,
- consistency calculations using the closed accounting framework of the SPEL/EU-Model.

The *advantages* of the activity-based SPEL-approach are:

- that the specific knowledge of experts from different fields of experience (changes in yields, input use, prices etc.) can be included and
- that it contains criteria for specific political instrument variables (including production area, number of livestock, etc.).

The main limitations of the short-term model stem from the fact that only the *immediate* effects on agricultural production and income are considered, but not the allocational responses to primary factors (labour, capital) and the feedback on investment and labour mobility which determine longer-term developments.

4.3. Index by table element codes

The following paragraph contains an alphabetical list of the table element codes. Each code is designed by their corresponding description and unit. If the table element is not known, the next paragraph allows the table element code to be found through an alphabetical list of keywords.

APPLAPPL	Apples & pears & peaches, yield apples & pears & peaches	kg/ha
APPLCACL	Apples & pears & peaches, crop & animal stocks	1000 t
APPLCAOF	Apples & pears & peaches, lime	kg PN/ha
APPLCOWO	Apples & pears & peaches, new plantation & contract work	NC/ha
APPLENEO	Apples & pears & peaches, overheads energy	NC90/ha
APPLENEV	Apples & pears & peaches, variable costs energy	NC90/ha
APPLGRMA	Apples & pears & peaches, gross margin	NC/ha
APPLGVAM	Apples & pears & peaches, GVA at market prices	NC/ha
APPLINAD	Apples & pears & peaches, input adjustments EAA	NC/ha
APPLINPO	Apples & pears & peaches, other overheads	NC90/ha
APPLINPV	Apples & pears & peaches, other variable costs	NC90/ha
APPLLEVL	Apples & pears & peaches, activity level	1000 ha
APPLMGVA	Apples & pears & peaches, modified GVA at market prices CAP	NC/ha
APPLNITF	Apples & pears & peaches, mineral nitrogen	kg PN/ha
APPLPHOF	Apples & pears & peaches, mineral phosphate	kg PN/ha
APPLPLAP	Apples & pears & peaches, plant protection	NC90/ha
APPLPOTF	Apples & pears & peaches, mineral potassic	kg PN/ha
