### *May-June 1996 cattle population survey*

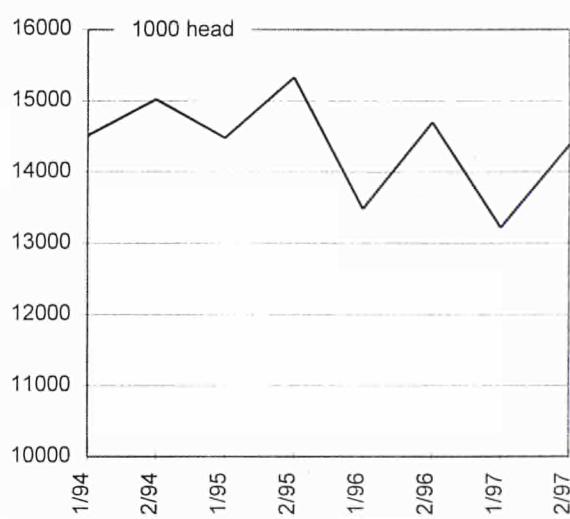

#### **Modest growth in the cattle population but meat supply on the market would appear to have dropped by 5% as a result of culling**

At Community level, the results of the cattle population survey reflect a continuation of the trend observed for the past two years, even though the survey was carried out at the height of the BSE (bovine spongiform encephalopathy) crisis. The dairy herd continued to shrink slowly (- 0.8%) and the rearing of bull calves showed a further decline (-2%) offset by the more extensive meat production resulting from greater numbers of suckler cows (+1.8%). In overall terms, the cattle population increased slightly (+0.7%). However, the supply of meat for human consumption appeared to have dropped in 1996 by 5% in relation to 1995 as a result of the health measures designed to remove from the food chain any animal likely to pass on the disease.

The cattle population survey of May-June 1996 was carried out between the sixth and the fourteenth week following the outbreak of "mad cow disease", at a point in time when beef and veal consumption had already started to recover in many countries after falls sometimes exceeding 30%.

The Community intervention measures aimed at supporting demand via the public purchase and storage of bovine carcases were already in place. In the United Kingdom a start had been made on implementing the slaughter programmes for animals likely to be affected by - or pass on - the disease, and the results of this survey have to be seen in this context. The level of livestock in this phase of the crisis represents a snapshot view which perhaps reflects momentary effects as much as underlying trends.

**Semi-annual evolution of the gross indigenous production of cattle in the EU**

**The cattle livestock in the EU in May-June 1996**

However, it is worth noting that according to the surveys carried out previously, the cattle population at Union level stabilised in 1994 after a period of extended decline. In 1995, this stabilisation was confirmed but there were no signs of an increase in the Community herd.

Despite the scale of the crisis in the beef and veal sector, the results of the survey of May -June 1996 are pretty much in line with the pattern of the previous surveys. Compared with June 1995, total livestock numbers in the Union rose slightly (+0.7%) while the number of cows remained almost stable. To comply with the quota regulation the downward trend in dairy cows continued compensating for the milk yield increase. Meanwhile the herd of suckler cows for extensive beef meat production is going up.

**Less bull calves**

As far as **animals for slaughter aged under 2 years** (excluding calves) are concerned, the trends observed since 1994 continued. This was the case both for male bovines, whose number fell still further by some 270 000 (-2%) after a fall of 200 000 between June 1994 and June 1995, and for heifers for slaughter, whose number dropped by a further 1%.

By contrast, **bovines for slaughter aged over 2 years** increased fairly substantially in number, with the number of both bulls and bullocks rising by 4.6 and 5.5% respectively. This therefore points to slaughter deferrals, with certain breeders apparently preferring to postpone the sale of animals for slaughter until the market rates increased. It is worth noting the

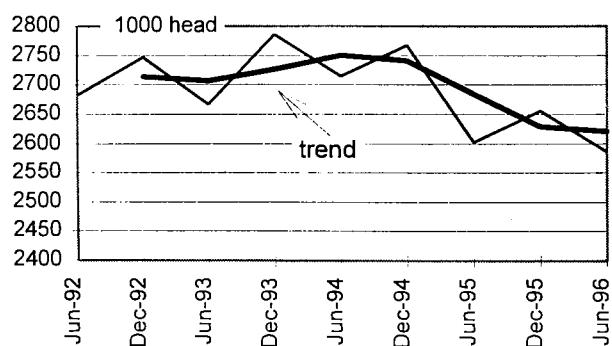

increase in the number of calves for slaughter (+4.4%), which was almost entirely attributable to Belgium and Germany, while in the main calf-producing countries (France, the Netherlands and Italy) trends remained.

**Country-specific overview**

Livestock numbers rose most sharply in **Ireland** (almost 4%), with almost all categories

affected. This marked a continuation of the uninterrupted growth of Ireland's bovine herd from its 1988 level of 6.45 million to its current level of 7.4 million. The sharp increase in numbers in relation to December 1995 (+900.000 head of cattle) should not come as a surprise, since this is a regular feature in this country where extensive meat production means that large numbers of animals are removed from pasture in the autumn. In **Greece**, the trend is inverse, since livestock - which barely exceeds 540 000 head of cattle - would once again appear be in decline after a respite in 1995. This trend is probably attributable to animal-health problems (other than BSE) affecting certain regions. Some ten years ago Greece's bovine herd stood at approximately 800 000.

Other noteworthy trends include a very substantial drop in the number of bull calves in **Belgium**, **Denmark**, **Germany** and the **Netherlands** and the development of an export-flow from Denmark to Germany of calves no longer fattened on the spot. It would seem that

**Evolution of the dairy herd in the United Kingdom**

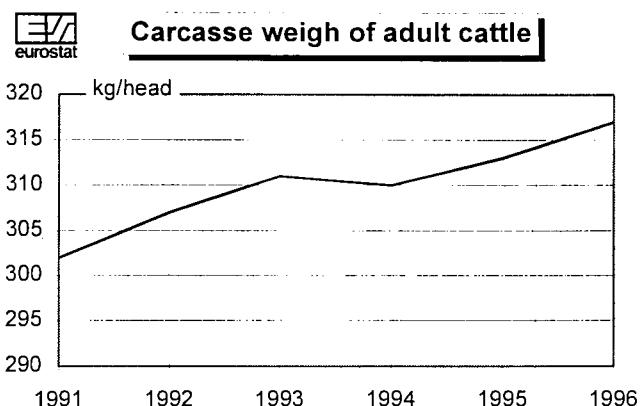

German breeders, like their Belgian counterparts, are to some extent focusing on the rearing of calves for slaughter, which would explain the very pronounced increases in this category (33% and 48% respectively). As regards dairy cows, numbers fell in Belgium (-5.3%) and the Netherlands (-3.5%), as well as in the three countries which acceded to the Union in 1995. In **Austria**, this trend (-4.8%) was more than offset by an increase in the number of suckler cows, so that today one in four of Austria's cows is classed as a suckler compared with one in ten at the time of Austrian accession.

UK livestock deserves a special mention due to the ban on beef and veal from the **United Kingdom** and to the culling programmes set up to eradicate the disease. One such programme covers calves and the other adult bovines aged over 30 months regarded as unsuitable for consumption and destroyed after slaughter. Up to the end of June, 240 000 animals were affected by these measures. Since the introduction of these programmes only really took effect as from May, it was not possible to make up all the delays in slaughter. This explains the fairly marked increases in livestock, particularly as regards animals for slaughter aged over 2 years (+12%). It is also probable that under normal circumstances the number of dairy cows would have fallen further as part of the decapitalization of the dairy herd started in 1994.

#### **Apparent drop of 5% in gross domestic production of bovine animals in 1996**

The current crisis in the bovine sector makes production forecasting even more difficult than usual. Bearing in mind livestock levels and currently available statistics on slaughtering, a fall of 5.5% in beef and veal production at Community level (assessed in terms of head of cattle) can be expected in relation to 1995. In tonnage terms the fall will probably be less pronounced, since the anticipated drop is likely to affect calves more than adult bovines (-8.1% and -4.8% respectively). Also, since slaughtering was subject to

many deferrals at the height of the crisis, the final weight of animals slaughtered was higher (possibly up to 4 kg for adult bovines).

Overall, the drop in production would seem to amount to 1.6 million head of cattle, of which 1.4 million for the United Kingdom alone. It should also be noted that in no other country of the Union is the fall likely to exceed 3%, while in some countries an increase is expected. Falls in production of between 2 and 3% are anticipated in Ireland, Italy, Portugal and Sweden, while in Germany and the Netherlands a fall of between 1 and 2% is expected. In Belgium and Austria the indications are that there will be an increase of about 6%. Elsewhere the results are likely to show that production has remained stable overall, although no recent estimate for Spain is available.

1997 looks set to see a stabilisation of beef meat production in most of the countries. The decrease of -1.2% in terms of head at EU level might be offset by a further increase of carcasse weights. As in 1996 the production of 1997 for human consumption is likely to be down some 5% on 1985 level. At the same time, the large-scale health-related culling programmes, which are not included in production accounting since they are outside the food chain, are likely to continue.

#### **Methodology**

In **Spain** the collected data have not yet been completely processed and the final results of the survey might be different. Furthermore no estimation of the cattle GIP is available for Spain at the moment.

In **Portugal** only one survey on the cattle herd is carried out each year in december.
