

EMPLOYMENT AND UNEMPLOYMENT

Not periodical

THE LABOUR FORCE IN THE EUROPEAN COMMUNITY

June 1985

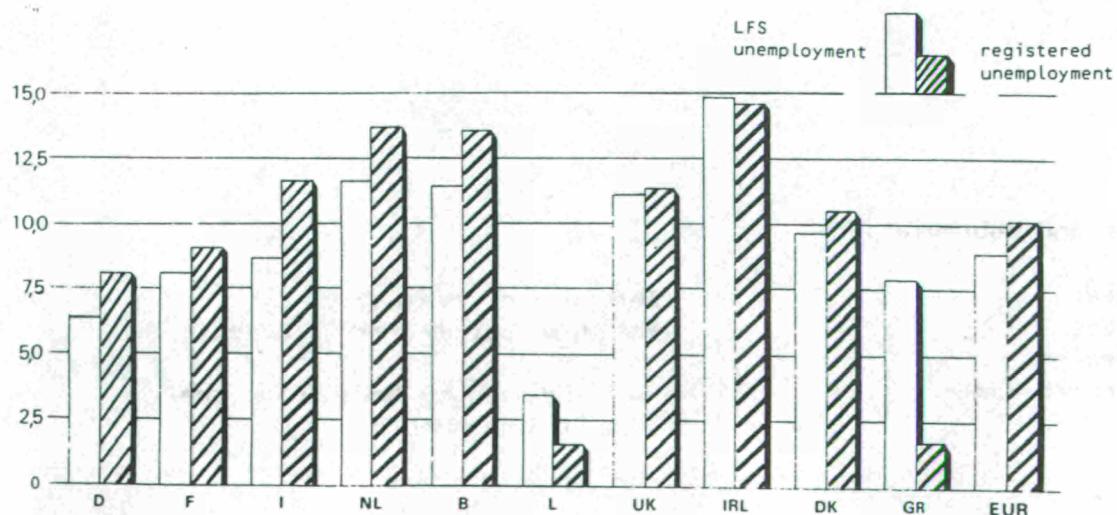

- Some special features -

The Community labour force sample survey for 1983 provides new information about employment and unemployment in the European Community. The survey gives more comparable results between countries than those available from other sources, and highlights certain characteristics of the labour market for which information is unavailable elsewhere.

Unemployment

The labour force survey (LFS) results show that the level and structure of LFS unemployment figures differ considerably from data on registered unemployed published monthly by EUROSTAT. The overall unemployment rate in Spring 1983 according to the labour force survey definition (see technical note) amounted to 8.9% for the Community of the ten compared to 10.1% for registered unemployed. Due to differing national legislation and administrative procedures concerning registration with employment offices, divergencies between the two unemployment rates also vary between countries. While the unemployment rate of

registered unemployed is considerably lower than the LFS rate in only two countries (Luxembourg and Greece), it is higher in six; in the United Kingdom and Ireland the two rates almost coincide.

It is also worth noting that only 80% of the unemployed according to the labour force survey are also registered at employment offices as unemployed. This means that more than 2 million people were looking for a job without being registered. On the other hand only 70% of registered unemployed are also identified as unemployed according to the labour force survey definition. The other 30% amounting to 3.5 million persons are classified as inactive or employed.

According to the survey results nearly 1 young person (14 to 24 years old) in 5 of the Community labour force is unemployed. The unemployment rate of young persons is therefore about 3 times higher than that for persons aged 25 to 49 years, for whom the Community average is 6.7%. The relative difference between the unemployment rates for these two age groups is greatest in Italy, where unemployment of young persons is six times more frequent (29% compared to less than 5%), while it is smallest in the United Kingdom (21,5% compared to nearly 14%). However, the unemployment rate for middle-aged persons in the United Kingdom is the highest of the Community.

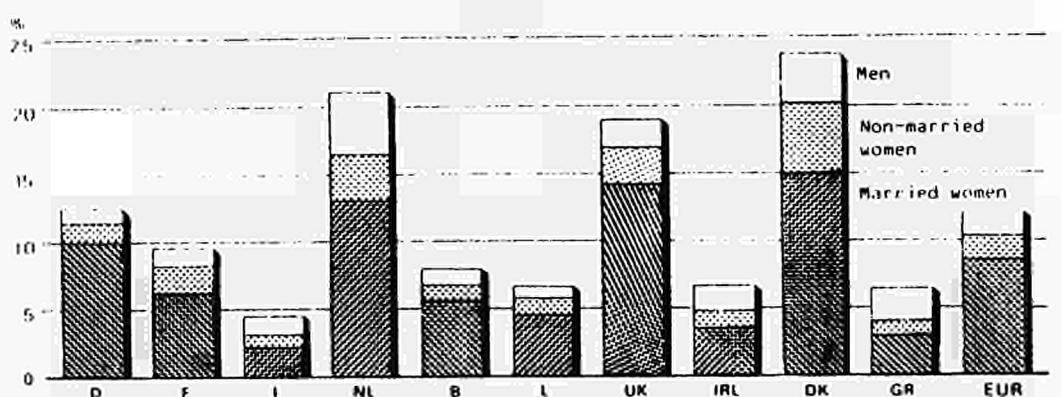

With regards to the youngest age group (14 to 19 years old) unemployment rates are even more alarming, the Community average attaining 25%. This means that for every three employed persons there is one unemployed. While only two countries (Germany with nearly 12% and Luxembourg with less than 10%) show a considerably lower unemployment rate for this age group, it is above 30% in four countries (France with 31%, Belgium and the Netherlands with around 32%, and Italy with 37%). Girls and young women are in general more susceptible to unemployment than boys and young men; the situation of female youth is worst in Italy, where there are 4 unemployed for every 5 employed young women.

These figures clearly indicate the problems which young people encounter in the transition from school to working life. They are further highlighted by the fact that, in the Community of the ten, about half (in Italy 80%) of the young unemployed (aged 14 to 24 years) do not have any work experience.

Part-time work

The labour force survey is also a unique source to pinpoint specific employment characteristics such as part-time work. At Community level nearly 13 million people are working part-time; this amounts to 12% of total employment. Whereas only 3% of all employed men are in part-time work, 28% of all employed women hold such a job. The proportion of part-time work for women varies greatly between countries. While in Italy and Greece only one in ten employed women holds a part-time job, 42% of employed women in the United Kingdom, 45% in Denmark and 50% in the Netherlands work part-time.

Diagram 2: Proportion of part-time employed in total employment

It is not surprising that part-time jobs are especially popular with married women; indeed, this group accounts for 70% of total part-time employment. Married women in the 25 to 49 years age group, many of whom have to care for children, hold half of all part-time jobs, whereas their share in full-time employment is only 13%. In Italy and Greece, where part-time jobs are relatively rare, this group accounts for only 30% of part-time employment; at 38% this proportion is also quite low in Ireland where, however, far less married women work than in any other country.

Three quarters of the 13 million part-time jobs are found in services, where they account for 16% of all jobs compared to 15% in agriculture and only 5% in industry.

Activity patterns

70% of all men aged 14 years and more in the Community either have or are seeking a job; the corresponding figure for women amounts to 40%. While the activity pattern for men is quite consistent between countries, female activity rates tend to vary greatly from country to country.

The Community average for female activity rises to 67% in the 20-24 year age group, declining gradually towards the 45-49 year age group and more sharply thereafter. Diagram 3 compares country patterns with the Community average :

- In the Netherlands, Ireland, Luxembourg and Belgium activity rates decline sharply immediately after their peak; for Belgium activity is highest in the 25 - 29 year age group.
- In Italy the pattern is similar to that of the female Community average but at a lower level.
- The age specific activity rates in Greece, though lower than average, are virtually constant between 25 and 44 years.
- For the United Kingdom there is a second peak, even higher than the first at the 45-49 year age group, where more than 70% of women are economically active.
- In France and Denmark female activity rates are constantly above the Community average, the Danish pattern approaching that for men.
- Finally, activity rates in Germany nearly coincide with the Community average.

There are also marked differences in activity patterns by marital status. In order to reduce the influence of age, the following analysis is confined to the 25 to 49 year age group.

Nearly all married men in this age group are working or are looking for a job; their activity rate attains 92%. Next highest are widowed or divorced men with 92%, while the rate for single men is only 89%. A large part of inactive single men is still in some form of education.

The order of female activity rates is somewhat different. Single women, with an activity rate of 82%, are most likely to work; widowed or divorced women (75%) work only slightly less, whereas the activity rate of married women is only 54%. Some exceptions from these Community rates are worth noting. In the Netherlands and the United Kingdom activity patterns of widowed or divorced women resemble much more that of married than of single women, while marital status has very little effect on activity rates in Denmark.

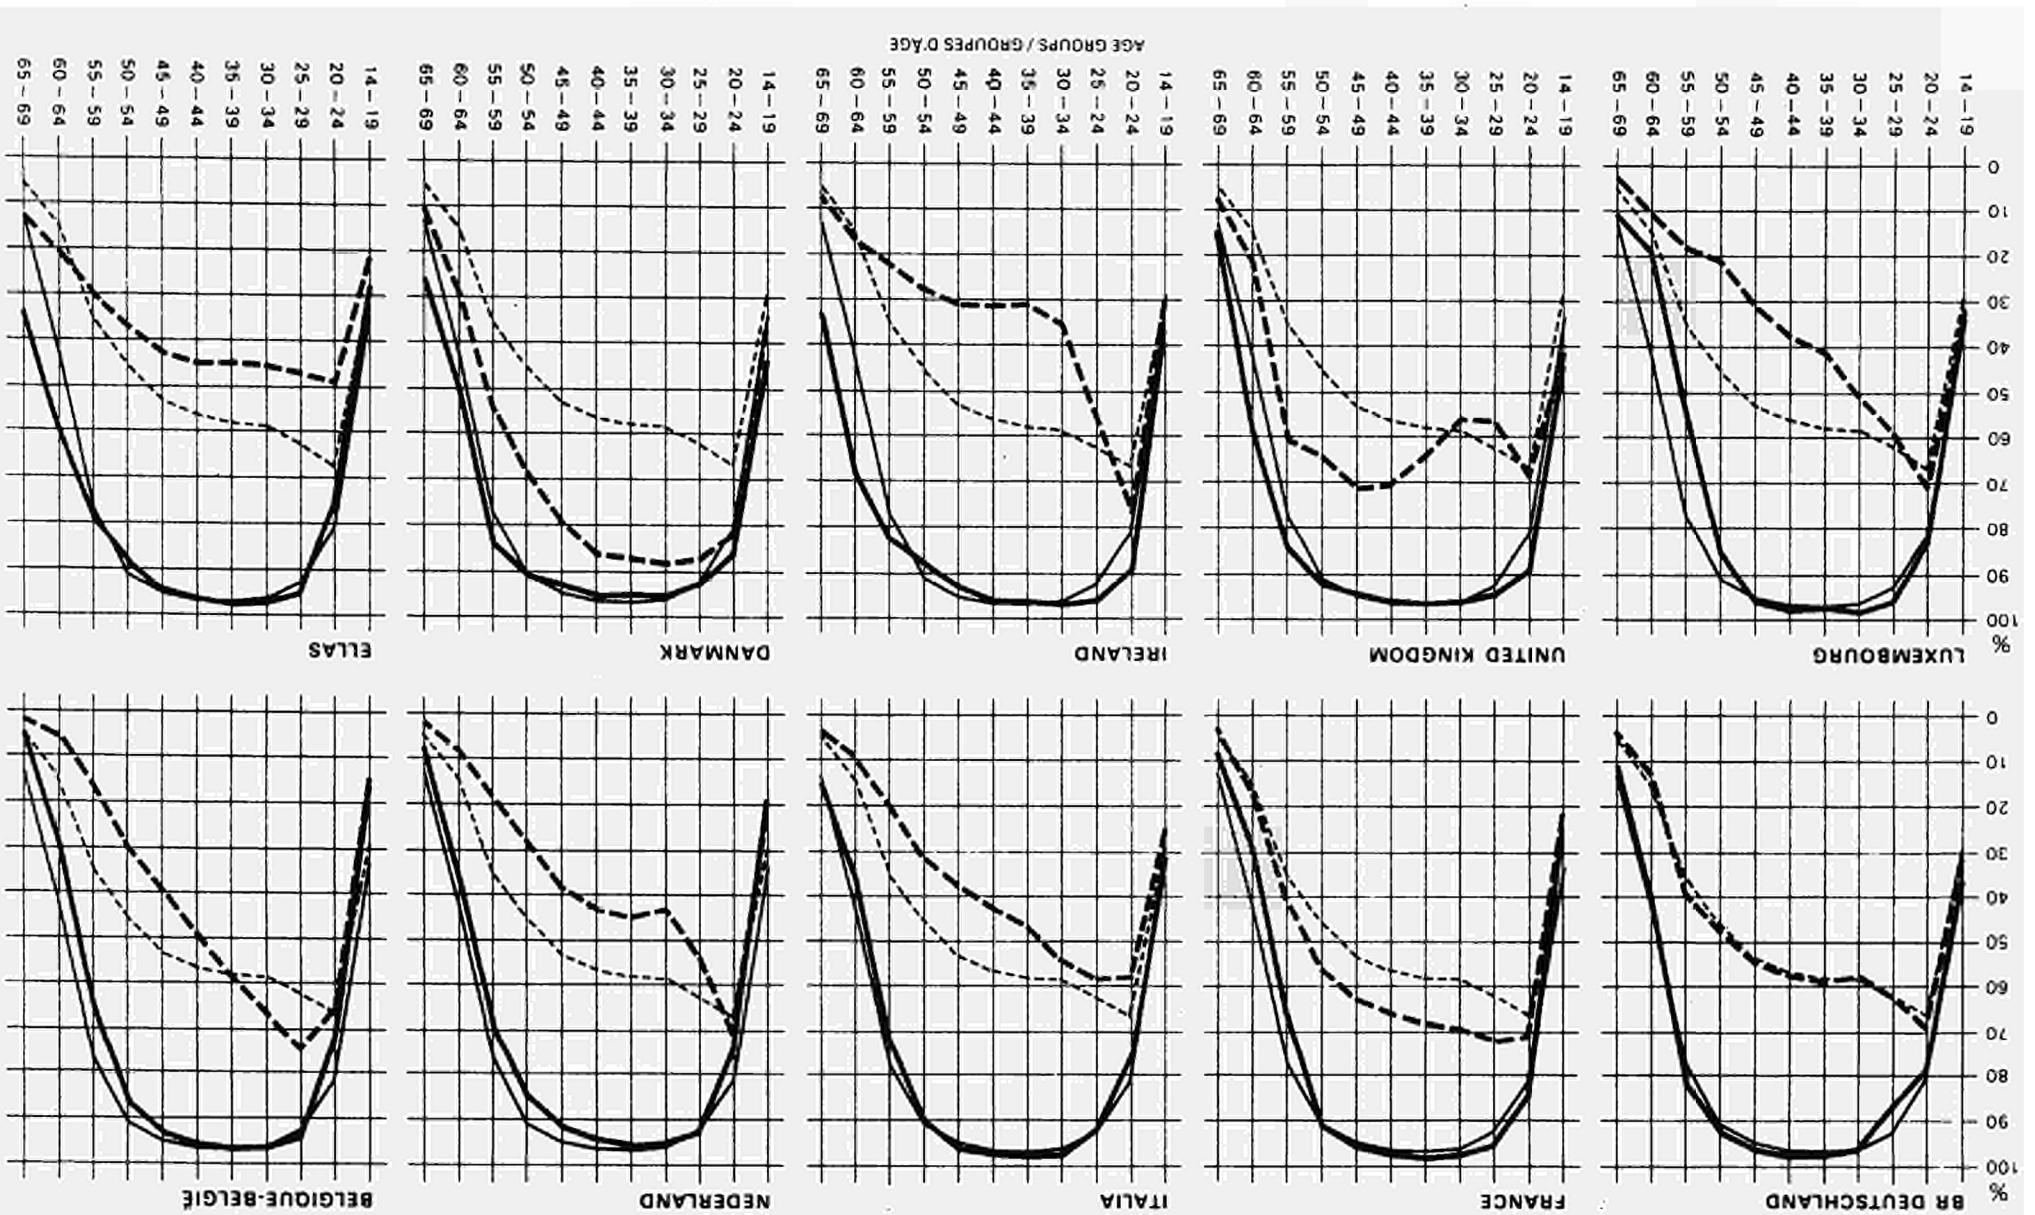

More comprehensive results will be presented in the forthcoming publication "Labour Force Sample Survey - 1983". A description of the methods and definitions used for the new series of labour force surveys from 1983 onwards, entitled "Labour Force Sample Survey - Methods and Definitions", is under preparation and will be published in the near future.

TECHNICAL NOTE

Basic concepts and definitions

The main statistical objective of the Labour Force Survey is to divide the population of working age (14 years and above) into three mutually exclusive and exhaustive classifications - persons in employment, unemployed persons and inactive persons - and to provide descriptive and explanatory data on each of these categories.

Respondents are assigned to one of these classifications on the basis of the most objective possible information obtained through the survey questionnaire, which principally relates to their actual activity within a particular reference week. The definitions are in line with those adopted by the 13th International Conference of Labour Statisticians in October 1982 (ILO-definitions).

Persons in employment

Employed persons are those who, during the reference week :

- (a) Did any work at all (work includes any work for pay or profit, i.e. paid work in the context of an employer-employee relationship, or self-employment. It also includes unpaid family work, which is defined as unpaid work contributing directly to the operation of a farm, business or professional practice owned or operated by a related member of the household).
- (b) Were not working but who had jobs or businesses from which they were temporarily absent because of illness, holiday, maternity leave, bad weather, labour dispute etc. It excludes however persons on lay-off and those with a new job to start in the future.

Unemployed Persons

Unemployed persons are those who had no employment during the reference week, and

- (a) were actively looking for paid employment in the context of an employer-employee relationship (i.e. had taken specific steps during a four-week period ending with the reference week to find a job) and were immediately available for work. Principal job seeking activities include : being on the register at a public or private employment office, meeting with prospective employers, checking with friends and relatives, placing or answering advertisements;
- (b) were looking to set up their own business or professional practice;
- (c) were waiting to be called back to a job from which they had been laid off;
- (d) had a new job to start after the reference week.

Under (a) it should be noted that a four-week period is used for measuring active job search, the reason being that delays inherent in job search (for example, periods spent awaiting the receipt of results of earlier job applications) require that the active element of looking for work be measured over a period greater than one week if a comprehensive measure of job-seeking is to be obtained.

For persons classified under (b) to (d) neither active job-seeking nor immediate availability for work is required.

For persons intending to set up their own business or professional practice both conditions are difficult to measure; job-seeking activities are of a particular nature for this group, while testing on immediate availability would be completely hypothetical.

Persons on lay-off are included in the unemployed on the grounds that their willingness to supply labour services is apparent in their expectation of returning to work. This very small group, which in 1983 amounted to about 1% of total Community unemployment, only existed in Ireland, Denmark and Greece.

For persons who have already found a new job to start at a later date, a similar argument to that for persons on lay-off is applied.

Inactive persons

All persons who are not classified as employed or unemployed are defined as inactive.

Apart from showing pupils and students separately, no further breakdown is provided for this group.

It should be noted that conscripts on compulsory military or community service do not belong to any of the above classifications, since they are excluded from the compilation of the survey results.

Labour Force

The labour force comprises persons in employment and unemployed persons.

The above classifications are used to derive the following measures:

Activity rates

Activity rates represent the labour force as a percentage of the population of working age living in private households.

Employment/population ratios

Employment/population ratios represent persons in employment as a percentage of the population of working age living in private households.

Unemployment rates

Unemployment rates represent the number of unemployed persons as a percentage of the labour force.

The above rates are usually calculated for sex-age groups and are sometimes further cross-classified by other demographic variables such as marital status or nationality.
