Eurostat hat die Aufgabe, den Informationsbedarf der Kommission und aller am Aufbau des Binnenmarktes Beteiligten mit Hilfe des europäischen statistischen Systems zu decken.

Um der Öffentlichkeit die große Menge an verfügbaren Daten zugänglich zu machen und Benutzern die Orientierung zu erleichtern, werden zwei Arten von Publikationen angeboten: Statistische Dokumente und Veröffentlichungen.

Statistische Dokumente sind für den Fachmann konzipiert und enthalten das ausführliche Datenmaterial: Bezugsdaten, bei denen die Konzepte allgemein bekannt, standardisiert und wissenschaftlich fundiert sind. Diese Daten werden in einer sehr tiefen Gliederung dargeboten. Die Statistischen Dokumente wenden sich an Fachleute, die in der Lage sind, selbständig die benötigten Daten aus der Fülle des dargebotenen Materials auszuwählen. Diese Daten sind in gedruckter Form und/oder auf Diskette, Magnetband, CD-ROM verfügbar. Statistische Dokumente unterscheiden sich auch optisch von anderen Veröffentlichungen durch den mit einer stilisierten Graphik versehenen weißen Einband.

Veröffentlichungen wenden sich an eine ganz bestimmte Zielgruppe, wie zum Beispiel an den Bildungsbereich oder an Entscheidungsträger in Politik und Verwaltung. Sie enthalten ausgewählte und auf die Bedürfnisse einer Zielgruppe abgestellte und kommentierte Informationen. Eurostat übernimmt hier also eine Art Beraterrolle.

Für einen breiteren Benutzerkreis gibt Eurostat Jahrbücher und periodische Veröffentlichungen heraus. Diese enthalten statistische Ergebnisse für eine erste Analyse sowie Hinweise auf weiteres Datenmaterial für vertiefende Untersuchungen. Diese Veröffentlichungen werden in gedruckter Form und in Datenbanken angeboten, die in Menütechnik zugänglich sind.

Um Benutzern die Datensuche zu erleichtern, hat Eurostat Themenkreise, d. h. eine Untergliederung nach Sachgebieten, eingeführt. Daneben sind sowohl die Statistischen Dokumente als auch die Veröffentlichungen in bestimmte Reihen, wie zum Beispiel „Jahrbücher“, „Konjunktur“, „Methoden“, untergliedert, um den Zugriff auf die statistischen Informationen zu erleichtern.

Y. Franchet  
Generaldirektor

It is Eurostat's responsibility to use the European statistical system to meet the requirements of the Commission and all parties involved in the development of the single market.

To ensure that the vast quantity of accessible data is made widely available, and to help each user make proper use of this information, Eurostat has set up two main categories of document: statistical documents and publications.

The statistical document is aimed at specialists and provides the most complete sets of data: reference data where the methodology is well-established, standardised, uniform and scientific. These data are presented in great detail. The statistical document is intended for experts who are capable of using their own means to seek out what they require. The information is provided on paper and/or on diskette, magnetic tape, CD-ROM. The white cover sheet bears a stylised motif which distinguishes the statistical document from other publications.

The publications proper tend to be compiled for a well-defined and targeted public, such as educational circles or political and administrative decision-makers. The information in these documents is selected, sorted and annotated to suit the target public. In this instance, therefore, Eurostat works in an advisory capacity.

Where the readership is wider and less well-defined, Eurostat provides the information required for an initial analysis, such as yearbooks and periodicals which contain data permitting more in-depth studies. These publications are available on paper or in videotext databases.

To help the user focus his research, Eurostat has created 'themes', i.e. subject classifications. The statistical documents and publications are listed by series: for example, yearbooks, short-term trends or methodology in order to facilitate access to the statistical data.

Y. Franchet  
Director-General

Pour établir, évaluer ou apprécier les différentes politiques communautaires, la Commission européenne a besoin d'informations.

Eurostat a pour mission, à travers le système statistique européen, de répondre aux besoins de la Commission et de l'ensemble des personnes impliquées dans le développement du marché unique.

Pour mettre à la disposition de tous l'importante quantité de données accessibles et faire en sorte que chacun puisse s'orienter correctement dans cet ensemble, deux grandes catégories de documents ont été créées: les documents statistiques et les publications.

Le document statistique s'adresse aux spécialistes. Il fournit les données les plus complètes: données de référence où la méthodologie est bien connue, standardisée, normalisée et scientifique. Ces données sont présentées à un niveau très détaillé. Le document statistique est destiné aux experts capables de rechercher, par leurs propres moyens, les données requises. Les informations sont alors disponibles sur papier et/ou sur disquette, bande magnétique, CD-ROM. La couverture blanche ornée d'un graphisme stylisé démarque le document statistique des autres publications.

Les publications proprement dites peuvent, être réalisées pour un public bien déterminé, ciblé, par exemple l'enseignement ou les décideurs politiques ou administratifs. Des informations sélectionnées, triées et commentées en fonction de ce public lui sont apportées. Eurostat joue, dès lors, le rôle de conseiller.

Dans le cas d'un public plus large, moins défini, Eurostat procure des éléments nécessaires à une première analyse, les annuaires et les périodiques, dans lesquels figurent les renseignements adéquats pour approfondir l'étude. Ces publications sont présentées sur papier ou dans des banques de données de type vidéotex.

Pour aider l'utilisateur à s'orienter dans ses recherches, Eurostat a créé les thèmes, c'est-à-dire une classification par sujet. Les documents statistiques et les publications sont répertoriés par série — par exemple, annuaire, conjoncture, méthodologie — afin de faciliter l'accès aux informations statistiques.

**PART ONE:**  
**BACKGROUND INFORMATION**

## 1. INTRODUCTION

This publication is the latest in a sequence of similar, normally annual (before 1990, quinquennial) publications by Eurostat.

It presents the definitive results (**purchasing power parities** and related economic indicators) of the comparison in real terms of the national accounts aggregates for the 19 countries which took part in Eurostat's annual programmes for 1995 and 1996. Preliminary results were published in the *Statistics In Focus* series (number 1998/10). These definitive results will not be revised again.

In economic analysis, Gross Domestic Product (GDP) is often regarded as the main indicator for measuring a country's economic activity during a year.

GDP can be obtained as the sum of the values added of all branches of production or as the sum of its final uses. In international comparisons it is generally the "uses" approach that is adopted, and GDP is broken down according to the various uses distinguished in the national accounts:

- final consumption expenditure of private households
- final consumption expenditure of private non-profit institutions
- final consumption expenditure of government
- gross fixed capital formation
- changes in stocks
- balance of imports (-) and exports (+) of goods and services.

International comparisons of economic aggregates such as GDP require

firstly that the basis of measuring the aggregates is consistent for the countries under comparison, and secondly that a comparable unit of measurement is employed.

Consistency in the basis of measuring the aggregates is achieved through compliance with the European System of National Accounts.

The differences in GDP expenditure values between countries correspond not only to a "volume of goods and services" component but also to a "level of prices" component, which can sometimes assume sizeable proportions (value = price x volume).

In order to obtain a true comparison of volumes, it is therefore essential to use conversion factors (spatial deflators) which reflect the differences in the level of prices between countries.

The use of exchange rates as the conversion factors does not allow a true comparison of the volumes of goods and services produced and used in the different countries. This is because exchange rates are determined by the many factors which affect demand and supply for currencies. In other words, exchange rates usually reflect other elements than price differences alone.

Purchasing power parities between the various countries' currencies have been specifically developed to be appropriate for use as conversion factors (spatial deflators).

Conventionally, economic aggregates which are expressed in national currencies or converted at exchange rates are known as *nominal* measures, and when converted using purchasing power parities they are known

as *real* measures. In general, the use of exchange rates overstates real volumes for countries with relatively high price levels, and vice versa.

Purchasing power parities are obtained as the averages of the price ratios between the different countries for a basket of comparable goods and services which are selected to represent the whole of a well-defined classification, and to be representative of consumption patterns in the various countries. They can be used to convert the values of the countries' economic aggregates expressed in national currency into a common currency. These new figures can then be used for a pure volume comparison, since the price level component has been eliminated.

Simultaneous temporal and spatial consistency is a goal which is difficult to achieve in practice (there is an ongoing theoretical debate about the possibility). The purchasing power parities presented in this document were not designed with this objective in mind. Rather, they are intended to give the best possible estimate of spatial relativities at a particular point in time. In consequence, comparisons between different time periods (eg. 1995/1996) are difficult due to changes in data and changes (improvements) in methods.

The 1996 results are generally felt to be of better quality than the 1995 results. In particular, there has been an improvement in the calculation of rents parities (methods and data sources) and in the accuracy of the detailed breakdown of GDP which is used for aggregation purposes.

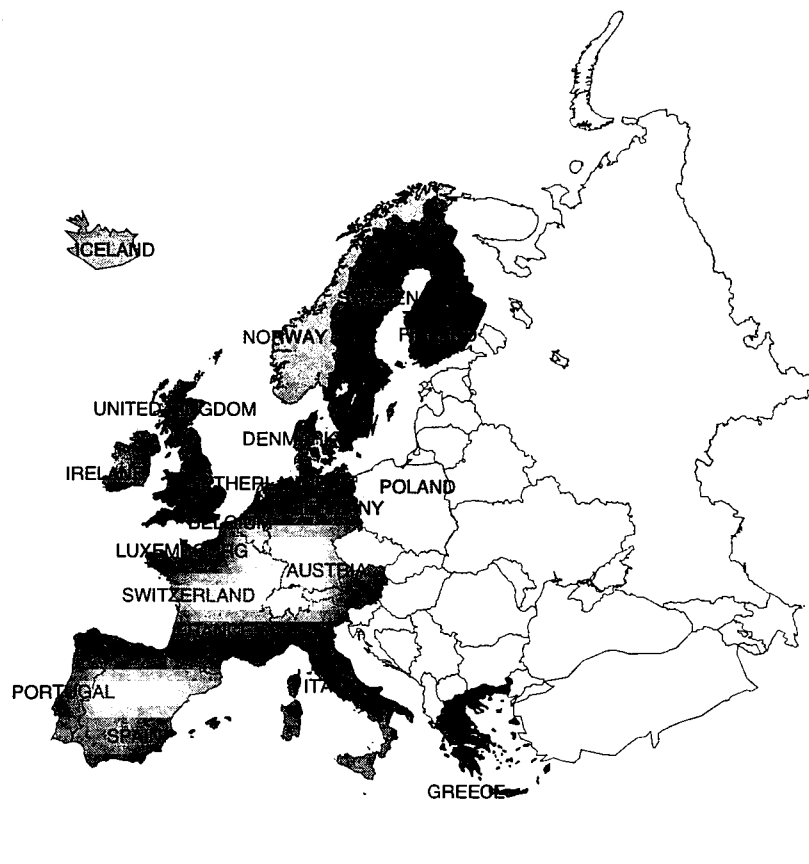

In 1995 and 1996, Eurostat coordinated the work for 19 countries: the 15 member states of the European Union, Switzerland, Norway, Iceland,

and Poland. Ten more countries will be joining the comparison programme with effect from 1999: Bulgaria, Cyprus, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Romania, Slovakia, and Slovenia.

Eurostat is grateful to the various participants in the Price Statistics Working Party on Purchasing Power Parities for their perseverance and the expertise with which they helped Eurostat complete the work presented in this document.

## 2. METHODOLOGICAL PRINCIPLES

As indicated in the introduction, the aim of the work is to eliminate the prices component which is inherent in any comparison of values between countries, in order to obtain a comparison of the volume of goods and services.

To this end, spatial deflators (ie. purchasing power parities) are calculated for each economic aggregate, which are averages of price ratios between countries. In other words, an "indirect" approach is used, which has two advantages:

- prices are generally much easier to collect than quantities;
- the variability of price ratios is generally much smaller than that of quantity ratios.

The fundamental problem is the choice of the basket of goods and services, bearing in mind that this choice will have a considerable influence on the results, since the countries concerned have major structural differences.

If the basket is relatively more characteristic of the consumption of one country, then given the negative correlation that usually exists between relative prices and relative quantities, this will lead to an underestimation of that country's prices compared with the others and, conversely, to an overestimation of its volume. This distortion due to an unequal relative characteristic of the basket is known as the Gerschenkron effect.

It is therefore essential that the methodological choices made at all stages of the work lead to a comparison based on a basket that is equi-characteristic of all of the

participating countries. Compliance with this principle favours the adoption of Fisher-type indices (see chapter 5).

The methodological options taken for international comparisons of economic aggregates have a much greater impact on the results than in the case of temporal comparisons. Temporal comparisons are constructed on a principle of graduality, which is easy to apply because there is a natural ordering of the situations compared. Thus consumer price indices are invariably presented as price changes from one (earlier) period to another (later) period.

Two situations far apart in time, with consequent major structural differences, are rarely compared directly but via a sequence of intermediate comparisons. Similarly with international price comparisons, the existence of major structural differences between the countries (due for example to differences in the levels of socio-economic development) also justifies the application of this principle. However, this is much more difficult because a natural ordering of the countries does not exist. The practical consequence of this is that whenever the information is available, all possible direct binary comparisons are used.

### 3. GENERAL FRAMEWORK

#### 3.1 Classification

As has already been mentioned, work on international volume comparisons is carried out in the context of the national accounts, particularly that of Gross Domestic Product (GDP) and its uses.

The precise definitions of the uses are given in the European System of Integrated Economic Accounts, 1979 edition (ESA'79). This will be replaced by the "1995-ESA" with effect from the 1999 year of comparison. In the case of household final consumption expenditure and government final consumption expenditure, the detailed classification is by purpose. Gross fixed capital formation is broken down according to a classification by type of product. The final consumption expenditure of private non-profit institutions, changes in stocks and the balance of import and exports are not broken down into sub-categories.

An exhaustive classification is established by successive break-downs of the aggregates. For example, household final consumption expenditure is first broken down into eight groups:

1. Food, beverages and tobacco.
2. Clothing and footwear.
3. Gross rent, fuel and power.
4. Furniture, furnishings and household equipment and operations.
5. Medical care and health expenses
6. Transport and communication.
7. Recreation, entertainment, education and cultural services.
8. Miscellaneous goods and services.

Each of the eight groups is then broken down into sub-groups, which in turn are further broken down into more detailed groups. This operation continues until the most detailed level of the classification, referred to as basic heading. This process can be illustrated by the following example:

Group 1, Food, beverages and tobacco, is broken down into:

- 1.1 Food
- 1.2 Non-alcoholic beverages
- 1.3 Alcoholic beverages
- 1.4 Tobacco.

Group 1.1, Food, is then broken down into:

- 1.11 Bread and cereals
- 1.12 Meat
- 1.13 Fish
- 1.14 Milk, cheese and eggs
- 1.15 Oils and fats
- 1.16 Fruit and vegetables other than potatoes
- 1.17 Potatoes
- 1.18 Sugar
- 1.19 Coffee, tea, Cocoa
- 1.10 Other foods.

Group 1.11, Bread and cereals, is then broken down into:

- 1.111 Rice
- 1.112 Flour
- 1.113 Bread
- 1.114 Pastries, cakes, biscuits
- 1.115 Pasta
- 1.116 Other cereal-based products.

Lastly, group 1.113, Bread, is broken down into:

- 1.1131 Fresh bread
- 1.1132 Special bread.

These last two subdivisions correspond to the most detailed level of the classification: basic headings.

The basic headings have a dual role:

- first of all, they constitute the most detailed level possible for which realistic expenditure data (weights) can be supplied by the countries. The reliability of these data is obviously not as great as at the more aggregated levels, but they give essential information about the structure of expenditure within each country. This information can then be used to aggregate the data for the basic headings in order to obtain results at all intermediate levels of the classification up to GDP;
- secondly, they can be used to single out homogeneous groups of products from which a number of specific products will be selected for price surveys.

In 1995, the exhaustive classification for the Eurostat comparison comprised 265 basic headings, and in 1996 the classification comprised 267 basic headings.

Data are collected with respect to the basic heading. On the one hand, expenditure data are derived from the countries' national accounts and on the other hand, a sample of products is determined for which prices are recorded. For each basic heading, the average of the products' price ratios provides the purchasing power parity. The purchasing power parities for the basic headings are then aggregated at all levels of the classification with the help of the expenditure weights.

### 3.2 Weights

Expenditure in national currency for the basic headings is obtained from the following sources of information:

- the estimates of GDP and its main uses for the reference year;
- a very detailed structure ranging from the main uses down to the component basic headings.

In order to obtain the detailed structure, Eurostat issues an annual questionnaire to participant countries. The data sources used to fill in the requested information differ from one country to another. As a rule, the results of national family budget surveys or the weighting structures of national consumer price indices are used for the detailed structure of household final consumption expenditure. The most recent data available are used for each country.

### 3.3 Prices

The basic headings constitute groupings of more or less homogeneous types of consumption expenditure, from which a sample of products is chosen for price surveys.

The choice of the sample for each basic heading is governed by the following criteria:

- it must be representative of the group of products;
- each product must be defined exhaustively, so that all the countries supply prices for products which are identical (or at least sufficiently similar to be comparable), thereby avoiding

- distortions due to quality differences;
- the sample must be equi-characteristic for all the countries. Any differences in the relative characteristicity of the sample create distortions in the results (the "Gerschenkron" effect). In order to ensure the equi-characteristicity of the sample, each country must include at least one product which is characteristic (ie. typical) of its own consumption. In conjunction with the method used to calculate the purchasing power parities for the basic headings, this procedure guarantees the equi-characteristicity of the basket representing the basic heading.

The resulting sample cannot necessarily be priced by all countries. Therefore, in the initial stages of the calculations, it does not necessarily allow each country to be compared directly with all of the others, but just with those countries with which it has the most affinity. This can be seen as an application of the graduality principle at basic heading level, which is just the practical consequence of the simultaneous application of the two principles of product comparability (identity or exhaustiveness of definition) and equi-characteristicity. In subsequent stages of the calculation process, it becomes possible to compare each country with each of the others (see chapter 5).

As the aim of the comparison is to compare the national accounts values in real terms, the prices collected must be consistent with the national accounts values. In general this means that they should be market prices actually paid by the purchasers.

The prices must be representative of the whole of the national territory and

correspond to the annual average of the reference year.

Prices are collected for the goods and services relating to basic headings which comprise the three main aggregates: household final consumption expenditure, government final consumption expenditure and gross fixed capital formation. For the other three aggregates the following parities are used:

- for the final consumption expenditure of private non-profit institutions, the parity for household final consumption expenditure;
- for the balance of imports and exports, the exchange rate;
- for changes in stocks, a calculated parity based on the parities for consumer and capital goods.

### 3.4 The ICP classification and the SNA classification

The national accounts expenditure data are collected in accordance with the European System of Accounts (version 1979), derived from the United Nations' System of National Accounts classification, which records expenditure on "individual" services provided by general government (education, health, recreation, cultural, religious and social security services) under government final consumption expenditure. This classification puts the emphasis on who pays for these services.

Clearly, use of the SNA classification precludes a complete volume comparison of these services, since they are scattered among different uses depending on the institutional differences in financing between countries. In order to obtain such a

## RESULTS FOR 1995 AND 1996

---

volume comparison, use is therefore made of the International Comparison Programme (ICP) classification, which includes these “individual” services under actual individual final consumption, putting the emphasis on who consumes them.

Other expenditures by government, namely those on general public services, defence, housing, community and economic services – from which households benefit collectively – are termed actual collective final consumption in the ICP classification.

The United Nations SNA 1993, upon which the “1995-ESA” is based, moves in the direction of the ICP classification.

## 4. PRICE COLLECTION

### 4.1 Household final consumption expenditure

For the purposes of the Eurostat comparison, prices are collected by the National Statistical Institutes (NSIs) of each country, under the co-ordination of Eurostat. Responsibility for the work is assumed by a working party comprising representatives of the NSIs, which lays down the methodology to be followed, discusses the definitions of the products which make up the survey sample, and adopts the results after analysis of the surveys.

The sample is constructed in accordance with the principle of graduality, taking account of the three criteria already mentioned:

- comparability;
- representativity;
- equi-characteristicity.

Whenever possible, branded products are used for easy identification. Otherwise, the definitions are exhaustive and include all the factors that might (a) influence prices and (b) enable the product to be identified.

In order to guarantee the equi-characteristicity of the sample, each country must, when drawing up the list, propose at least one product which is characteristic of its own consumption for each basic heading. At the end of the survey, when the NSI supplies the prices which were recorded, it also provides indications of representativity for the various products. This information is used in the calculation of the parities for the basic headings so as to guarantee equi-characteristicity.

The size of the sample is roughly 3000 – 3500 products. Each country does not have to record prices for the whole of the sample, and would probably be unable to do so. The number of products for which a price is given varies from one country to another.

The surveys are carried out in the countries' capitals. As the target average price is that for the whole of national territory, some NSIs supply spatial coefficients by group of products which can be used to convert the capital city price to the national average price. For other countries, the average price in the capital is deemed to represent the national average. Certain NSIs conduct surveys in several cities simultaneously, thereby obtaining directly an average price which is believed to be representative of the whole of the national territory.

The surveys are spread over three years. The 1995 comparison is based on the results from the following consumer price surveys:

- Spring 1993:  
Furniture, glassware, tableware
- Autumn 1993:  
Personal transport equipment, other goods and services
- 1993:  
Medicines, other medical products and medical services.
- Spring 1994:  
Durable goods.
- Autumn 1994:  
Clothing and footwear.
- *Spring 1995:*  
*Food, beverages and tobacco.*
- Autumn 1995:  
Services.

The 1996 comparison is based on the following consumer surveys:

## RESULTS FOR 1995 AND 1996

- Autumn 1993:  
Personal transport equipment,  
other goods and services
  - 1993:  
Medicines, other medical  
products and medical services.
  - Spring 1994:  
Durable goods.
  - Autumn 1994:  
Clothing and footwear.
  - Spring 1995:  
Food, beverages and tobacco.
  - Autumn 1995:  
Services
  - Spring 1996:  
Furniture, glassware, tableware.
- 4. Minimarkets, neighbourhood  
shops, service station shops
  - 5. Traditional shops
  - 6. Markets
  - 7. Service enterprises in the private  
sector
  - 8. Service enterprises in the public  
sector
  - 9. Others (mail order, sales at the  
customer's premises, mobile  
shops).

For each product, it is difficult to give precise instructions regarding the number of price quotations to be recorded, owing to the characteristics specific to the various countries and the product itself.

As the target average prices are the annual average prices for the reference year, the NSIs supply detailed monthly consumer price indices covering the 219 basic headings of consumption. On the basis of these indices, temporal coefficients are calculated in order to convert the average prices at the time of the survey to the annual average prices for the reference year.

For products with a unique price, one price quotation is sufficient. For the others, the degree of price dispersion and the degree of availability of the product should determine the number of price quotations. Bearing these criteria in mind, each country is typically expected to supply between 1 and 15 prices per product.

The outlets where prices are to be collected are selected by the NSIs. However, this choice must be in keeping with the national structure of retail sales by outlet types, depending on the group of products in question. Accordingly, the prices recorded are automatically weighted in order to arrive at an average price which is representative of the country's retail sales consumption.

### 4.1.1 Rents

The data on rents are generally taken from information available in the countries from special surveys on housing or from the family budget surveys or collected for consumer price index purposes. For the purposes of comparison in this sector, a number of types of dwelling have been selected on the basis of the following criteria: the age of the dwelling, the type of dwelling (flat or house), the amenities (running water,

Retail outlets are divided into the following categories:

1. Department stores, "popular" department stores, specialist superstores
2. Supermarkets and hypermarkets
3. "Hard discount" outlets

toilet, bath, heating, etc.), the number of rooms and the floor area.

The floor area is not known with any great degree of accuracy in some countries, and it has been necessary to create area classes in order to be able to estimate prices per square metre.

The number of types of dwelling is fairly high (24) and the choice takes account of the diversity of the stock of dwellings in the participating countries. It is not necessary for all the countries to supply rents per square metre for all the types of dwelling.

The imputed rents for owner-occupied dwellings are estimated on the basis of the actual rents of the equivalent dwellings (except in the case of subsidised rents), in line with standards laid down in the ESA.

For 1995, the parities were calculated by updating the ones resulting from the survey in 1993, using detailed price indices (similar to the method used for consumer goods and services). For 1996, parities were calculated using new data collected from the 1996 survey. Certain countries have changed their method of calculating gross rents for the 1996 comparison.

#### **4.1.2 Healthcare**

The comparison of healthcare expenditure is difficult due to the differing national accounting concepts used, and to the problems of price collection. A major problem arises from the different treatments under the ICP and SNA formats.

The calculation of purchasing power parities in accordance with the SNA classification recognises the separation of healthcare expenditure under household final consumption

expenditure, government final consumption expenditure and final consumption expenditure of private non-profit institutions. To calculate purchasing power parities in accordance with the ICP classification, all health expenditure is lumped together and transferred to the heading "actual individual final consumption".

The following information is collected for calculating healthcare parities:

- market prices are collected for three groups: medical and pharmaceutical products, therapeutic appliances and equipment, and the services of physicians, nurses and related practitioners. In several countries, the prices are those which are actually charged; in others, they are estimates of the total price (ie. the sum of the amount paid by consumers and the subsidy paid by government). These estimates are reasonable for the first two groups (medical products and therapeutic equipment), but very difficult for certain parts of the third group (services) when no payment is rendered ;
- for hospital care, the approach adopted is based on the prices of the "inputs". Even in countries where the hospitals have scales of charges, the prices are often heavily subsidised by government. Purely private clinics are of limited importance in all the countries. Expenditure in hospitals is divided into three groups: compensation of employees; intermediate consumption; depreciation. For the first of these, data on wage costs for a number of different hospital occupations (doctors, paramedic staff, administrative staff) are collected: surveys were conducted in both 1995 and 1996. For the other two groups, parities are

calculated using the information obtained from other surveys.

The input price approach is based on the assumption that services not sold at market prices have a value equal to the value of production estimated on the basis of the costs incurred. It is implicitly assumed that productivity is identical in all the countries - an assumption that shows the limitations of this approach. In actual fact, productivity depends not only on factors such as the quality of the staff but also on the whole equipment infrastructure placed at their disposal.

Eurostat is currently undertaking research into the possibilities of alternative solutions for the calculation of healthcare parities.

#### 4.2 Government final consumption expenditure

The United Nations' Classification of the functions of government (COFOG) is used to define the main components of government final consumption expenditure (GFCE). A distinction must be drawn between services that households consume collectively and those that they consume individually. General services, defence, housing, community development services and economic services are collectively consumed services. They are lumped together and treated as a single category of expenditure. Education, health products and care, and other services (social security and welfare; recreational, cultural and religious services) are services consumed individually. They are treated as separate categories of expenditure.

In other words, GFCE is broken down into four categories of expenditure:

- collective services of general government;

- education;
- health;
- other individual services.

In order to compare the total volume of the services consumed by households, in accordance with the ICP classification used for international comparisons, the expenditure on individual services of the GFCE (education, health and other individual services) is transferred to the relevant heading within actual individual final consumption and added to the expenditure on similar services paid by households.

As the services produced by general government are not generally sold at market prices, the value of these services is, in accordance with the national accounts concepts, assumed to be equal to the value of production calculated on the basis of the costs incurred. Consequently, the input price approach is the one adopted. The characteristics and limitations of this approach have already been described in connection with the comparison of expenditure in hospitals.

The input price approach is used for the collective services of general government and for education. For the majority of the countries, these two categories represent the bulk of general government expenditure on non-market services. In both cases, three basic headings are defined by type of cost, as follows:

- compensation of employees;
- intermediate consumption;
- consumption of fixed capital.

In order to calculate parities for the compensation of employees, the NSIs recorded this variable for a list of standard occupations in general government in 1995 and again in 1996. These occupations are representative of the education levels and occupational categories usually found in general government and are therefore easily identifiable by all the countries. The compensation of employees is calculated for each occupation selected and the amount must be in keeping with the ESA definition. It therefore includes all payments made and all benefits provided in compensation for the work done. These payments and benefits comprise:

- a) gross wages and salaries,
- b) employers' actual social contributions,
- c) imputed social contributions.

Gross wages and salaries (ie. without deduction of taxes and social contributions paid by employees) cover not only direct wages and salaries as shown in the pay scales but also a whole series of elements added to the basic wage or salary. These are not the same in all the countries and their overall value may constitute as much as one-third of the total expenditure in respect of an employee. They include:

- family allowances (assuming a married employee with two dependent children);
- general allowances;
- household or residence allowances;
- special allowances;
- 13th month payments;
- holiday or end-of-year pay;
- overtime;
- bonuses and gratuities of any kind.

In order to facilitate comparability between countries, the occupations are defined on the basis of the job descriptions taken from the 1968 and 1988 versions of the ILO's International Standard Classification of Occupations (ISCO).

No data are collected for intermediate consumption and consumption of fixed capital. The parities for household final consumption expenditure and gross fixed capital formation are used respectively. For medical services, the parity for the heading "Health" under household final consumption expenditure is used, whilst for the other individual services the parity used is that for collective services, education and health.

### 4.3 Gross fixed capital formation

In this sector, national price surveys are in many cases non-existent or else they cover only certain groups of products. Furthermore, the methodological concepts used vary from country to country. Moreover, a survey of the prices of fixed capital goods, with the definition and recording of prices for equipment goods or construction buildings that are often highly complex, requires specific technical knowledge and the use of highly qualified personnel.

For these reasons, the 1995 and 1996 surveys were carried out in most countries by architects or engineers, who are not only technicians but also have a knowledge of the market and the special features of their respective countries.

The classification used is based on the type of products: equipment goods, residential buildings, non-residential buildings, civil engineering works; it corresponds to the NACE-

CLIO groupings, which are a standard classification of products.

#### 4.3.1 Equipment goods

For equipment goods the detailed description of the technical characteristics is absolutely essential to ensure precise identification of each product.

The technical characteristics must refer above all to performance data (capacity, speed, power, size, output, etc.), operating data (hydraulic controls, number of speeds, power source used, etc.) and data relating to the quality of the machine (steel quality, weight of the machine, precision of work). The performance data are the most important and are absolutely binding, ie. they should be the same in all countries, whereas the others may be interpreted with some flexibility.

For a large number of products it is also necessary to define additional characteristics, such as details of accessories to be included in the price, as well as the terms of payment, any installation costs, after-sales service and the number of products purchased.

The prices supplied must be consistent with the expenditure values that make up Gross Fixed Capital Formation in the national accounts, ie. the purchase prices actually paid by the purchaser of a fixed capital good. This price generally includes distribution costs, installation costs and non-deductible VAT, less any rebates normally given.

The price must reflect the average level of prices in the whole of the national territory; this condition is fairly easy to meet since, for most products, the market is dominated by a large national producer or a large inter-

national firm which sells its product on the same terms throughout the country or which can provide information on any differences in prices which it applies.

As it would be too costly to record prices at several dates during the year, the work of obtaining annual average prices is carried out on the assumption that variations in prices are spread uniformly throughout the year, and is limited to a single recording of prices in the middle of the year.

The products are chosen according to the same criteria used for consumer products, namely: representativity of the products chosen within the group, characteristicity of the products chosen for the participating countries, strict definitions in order to ensure comparability between countries.

#### 4.3.2 Construction and civil engineering

The major difficulty in this sector stems from the fact that identical or comparable buildings do not exist, even within a country, and even less between different countries. For the same type of building, there may be substantial differences as regards shape, size, location, finishing, materials used, etc.

For the purposes of international comparisons, a method has therefore been devised which involves defining a standard project and estimating the price as though it had actually been built. This method, known as the "standard construction projects method", comprises the establishment, on the basis of a construction plan, of a detailed bill of quantities giving rise to the definition of a "standard" construction, which forms the basis for the comparison.

First of all, a bill of quantities is broken down into a number of major components, such as earthworks, foundations, masonry, joinery, painting, etc. Each of these major components comprises a number of elementary components defining the construction work or operations specific to a given item by means of a precise description of the work to be carried out and the materials to be used. In accordance with this method, a wall, for example, is defined by the type of bricks (of concrete, sand-lime, baked), their size, the finishing (joining, plastering, mortaring, number of coats of paint, wallpaper).

The description of each element on the basis of the materials/labour ratio leads to the determination of a quantity (m, m<sup>2</sup>, m<sup>3</sup>, kg), to which a unit price valid for this type of operation must be applied.

It is acknowledged that, because construction standards, regulations, materials and methods vary from country to country, a certain latitude of interpretation is necessary if the countries are to supply characteristic prices for the various projects. The general rule is that, if the effect of complying with the specifications to the letter is that a material cannot be readily used or a special price study is necessary, the price of a more common material must be supplied, since the object of the exercise is to avoid non-representative prices.

The bills of quantities have been designed to be representative of actual constructions in the countries with regard to their shape and size, their finishing, their internal fittings and, to a lesser extent, to the construction materials and methods used. Since there is a close link between the construction materials used and the construction methods adopted, and since both materials and methods vary between countries,

variants for a number of components are included in the bills of quantities.

The information on the characteristic of each variant in the different countries is taken into account in the calculation of the parities for the basic headings.

The list for the 1995 Eurostat comparison comprises the following works:

- Residential buildings  
One-family house - Detached house - Flat in an eight-storey block
- Non-residential buildings  
Agricultural shed - Factory building - Office building - Primary school
- Civil engineering  
Construction of an asphalt road - Construction of a concrete road - Sewer main - Sports field - Construction of a bridge.

*The list for the 1996 Eurostat comparison comprises the following works:*

- Residential buildings  
One-family house - Detached house - Flat in an eight-storey block - Renovation project
- Non-residential buildings  
Agricultural shed - Factory building - Office building - Primary school
- Civil engineering  
Construction of an asphalt road - Construction of a concrete road - Sewer main - Sports field - Construction of a bridge.

The prices supplied must be market prices which would actually be paid by the principal. The price of a construction project includes such items as architect's fees, the rate of non-

## **RESULTS FOR 1995 AND 1996**

---

deductible VAT, lawyer's fees, patent fees, special local taxes, and the cost of installations for storing materials.

The unit prices used in the evaluation of buildings and works are derived from a large number of existing bills of quantities, submitted by construction enterprises when tendering for work; they therefore constitute a good representative average.

As an alternative solution the unit prices can be obtained from a computerised system of unit costs for the construction industry kept by major consultancy firms and research institutes.

As in the case of equipment goods, the prices are recorded in the middle of the year, the assumption being that the prices at that date correspond to the annual average. They must likewise reflect the average level of prices throughout the national territory, taking regional differences into account.

## 5. METHODS

The distinction between basic headings and aggregations is made for purely statistical reasons, both in order to define homogeneous groups of products and to obtain highly detailed weights needed for aggregating the basic headings parities to GDP. The calculation methods within the basic headings differ slightly from those used for the aggregations on account of the different nature of the data, but the methodological principle is the same, namely the equi-characteristicity of the basket underlying the comparison.

It is also important that the methods used guarantee the transitivity of the results (purchasing power parities and consequent economic indicators, such as real GDP volume ratios). If the parity is denoted by  $P$  and three countries taking part in the comparison by  $a$ ,  $b$  and  $c$ , the condition of transitivity is met if:

$${}_aP_b = {}_aP_c \div {}_bP_c$$

This means that a direct comparison between any two countries can also be obtained indirectly via any linking of countries.

### 5.1 Parities for basic headings

The calculation of purchasing power parities for the basic headings is closely linked to the methods used to form the sample of products covered by price surveys.

At the end of each price survey, the following data are available for each country and each basic heading:

- average prices for a number of the products in the basic heading;

- information on characteristicity for all the products in the basic heading for which it has supplied a price. It should be remembered that, when the sample (ie. the product list) was being constituted, each NSI was asked to include at least one product which is characteristic of its national consumption, for each basic heading.

In order to ensure the equi-characteristicity of the basket underlying each basic heading, a three-stage procedure is used. For each pair of countries a parity is first obtained as the geometric mean of the price ratios for the products characteristic of the first country:

$${}_a\hat{L}_b = \left( \prod_{i=1}^k \frac{{}_aP_b^i}{{}_aP_a^i} \right)^{1/k}$$

where  $k$  is the number of products characteristic of country  $a$ ,

${}_aP_b^i$  and  ${}_aP_a^i$  are the average prices in countries  $b$  and  $a$  of product  $i$  (characteristic of country  $a$ ). This is considered to be a Laspeyres-type estimate, since the typical pattern of the base country is used with a weighting of 0 (zero) for the products which are not typical of that country.

A second parity is then calculated for the same pair of countries as the geometric mean of the price ratios for the products which are characteristic of the partner country:

$${}_a\hat{P}_b = \left( \prod_{r=1}^m \frac{{}_bP_b^r}{{}_bP_a^r} \right)^{1/m}$$

where  $m$  is the number of products characteristic of country  $b$ ,

${}_bP_b^r$  and  ${}_bP_a^r$  are the average prices in countries  $b$  and  $a$  of product  $r$  (characteristic of country  $b$ ). This can be regarded as a Paasche-type estimate.

Thirdly, a new parity is calculated, which is the geometric mean of the first, Laspeyres-type parity and the second, Paasche-type parity. This can be regarded as being of the Fisher type:

$${}_a\hat{F}_b = \left( {}_a\hat{L}_b \cdot {}_a\hat{P}_b \right)^{1/2}$$

The geometric mean of the Laspeyres-type and Paasche-type parities can be regarded as a price ratio for a basket which is equi-characteristic of the two countries. Even if the first country finds many more products which are characteristic of its own consumption in the sample than the second country does, this procedure enables the two countries to be placed on a more equal footing.

Theoretically, this exercise can be carried out for all the pairs of countries in the whole group. In practice, at this stage of the calculation process not all countries can be compared directly. This can be interpreted as an application of the principle of graduality in the absence of a natural ordering of the countries.

The table of Fisher-type binary parities as obtained above may be incomplete (because certain binary Laspeyres or

Paasche parities could not be established, due either to the absence of product prices or of characteristicity indicators). Also, the table is not transitive. By applying the so-called EKS procedure, a full table of transitive parities for the basic heading is obtained. The EKS procedure is essentially a regression calculation which involves minimising the following distance criterion :

$$\Delta = \sum_{t=1}^z \sum_{s=1}^z \left( \log_s EKS_t - \log_s F_t \right)^2$$

where  ${}_sEKS_t$  and  ${}_sF_t$  denote respectively the EKS parity and Fisher parity between country  $t$  and country  $s$  and where  $z$  is the number of countries.

The procedure is as follows :

$${}_tE\hat{K}S_s = \left( \prod_{i=1}^z \frac{{}_t\hat{F}_i}{{}_s\hat{F}_i} \right)^{1/z}, \forall t, s$$

## 5.2 Aggregations

With the current annual system of calculations, the basic heading parities which are input into the aggregation calculation are obtained either from new surveys or from previous surveys, updated using price indices. Whichever the source, the end result is a complete table of parities for all the countries, for each basic heading, for the year in question.

The other input into the calculation is a full table of GDP expenditure values, used for weighting purposes. Using these data, purchasing power parities can be calculated for all the

aggregates in the classification up to the level of total GDP.

In accordance with the principle of equi-characteristicity, a Fisher parity is calculated for each pair of countries and each aggregate. The resulting matrix of bilateral Fisher parities is then made transitive by applying the EKS procedure in the same ways as is done at basic heading level:

$${}_t E\hat{K}S_s = \left( \prod_{i=1}^z \hat{F}_{i/s} / \hat{F}_i \right)^{1/z}, \forall_{t,s}$$

### 5.3 The "fixity" of the European Union results

In order to obtain the parities for the 19 countries taking part in the 1995 and 1996 Eurostat comparisons, a three-stage procedure was adopted:

- first of all, the results for the fifteen member states of the European Union were calculated;
- secondly, the results for all the 19 countries were calculated;
- lastly, the results of the first calculation replaced the results of the second calculation for the European Union countries.

This procedure preserves the relationship between the European Union countries in the wider comparisons. This "fixity" procedure is necessary because the EKS formula takes into account all possible direct and indirect bilateral comparisons – and is therefore sensitive to the number of countries participating in the comparison. The European Union results are widely used in the political decision-making process (for example GDP per capita in real terms is one of

the key criteria in deciding whether regions qualify for financial assistance under the Structural and Cohesion Funds). "Fixity" is therefore necessary to avoid the appearance of differing results between the European Union countries in the various comparisons.

Nevertheless, the use of an extremely stable calculation method such as the EKS minimises the differences between results obtained with or without "fixity".

### 5.4 The unit of measurement

The purchasing power parities presented in this document are expressed in an arbitrary reference unit, a *numeraire*, known as the purchasing power standard (PPS). This numeraire is defined in such a way that, for each individual aggregate, the European Union total obtained from converting the values in national currency with the purchasing power parities is equal to the European Union total for that individual aggregate in ecus. In a sense, the PPS can therefore be thought of as the ECU in real terms.

In practical terms, this involves a multi-stage procedure. The parities are initially calculated by reference to an arbitrary base country. These parities are then standardised by re-expressing them relative to the simple geometric mean of the parities for the 15 member states of the European Union (the EU15). These standardised parities are then used to convert the GDP expenditure values in national currencies, and the sum of the resulting figures for the EU15 is calculated ( $\sum GDP_{ppp}^{EU15}$ ). In parallel, the GDP expenditure values are re-stated in ECU, and the sum for the EU15 calculated ( $\sum GDP_{ecu}^{EU15}$ ). This allows a linear conversion factor to be identified ( $\sum GDP_{ppp}^{EU15} \div \sum GDP_{ecu}^{EU15}$ ). This factor is used to scale the GDP

values converted using the standardised parities. The resulting scaled figures are then divided by the GDP expenditure values in national currency in order to identify the (scaled) purchasing power parity – the PPS. This scaling procedure does not alter the relationship (parity) between countries – it only changes the unit in which they are expressed.

### 5.5 The system of annual calculations

Since 1990, a system of annual calculation has been implemented. Every year this involves carrying out new surveys on 1/3 of the basket for household final consumption expenditure. The other 2/3 are covered by extrapolating the basic headings parities derived from the surveys in the previous years by means of detailed national price indices. Data on public sector wages and salaries (for government final consumption expenditure) and on prices for equipment goods and construction (for gross fixed capital formation) are collected annually.

The expenditure weights used are those of the reference year for the main aggregates, and the most recent ones available for the more detailed breakdowns. For 1995, the values used were those available to Eurostat in February 1997. For the 1996 comparison, the values used were those available in August 1998.

This system has the great advantage of providing every year a full comparison of GDP and its uses based to a large extent on up-to-date data or on extrapolated data going back two years or even less. Methodological coherence between successive annual measurements is much more readily guaranteed.

### 5.6 Revisions policy

Traditionally, Eurostat makes two results presentations in connection with each annual comparison exercise. The first of these is a preliminary estimate in late Winter / early Spring (published by Eurostat at the level of total GDP in the *Statistics In Focus* series, and provided to other departments within Eurostat for use in publications of preliminary National Accounting estimates at the level of total GDP and the main aggregates). Subsequently, a definitive calculation is made and published at the level of the 54 SNA or 53 ICP analytical categories (eg. this publication).

Each calculation is made on the basis of the best information available at the time. Typically, for the second calculation, a significant amount of new information exists, particularly relating to the breakdown of National Accounts expenditure values. This data is always introduced, in order to improve the quality of the results. Inevitably, this can lead to changes in the purchasing power parities (and related economic indicators) which were previously calculated and published for the year in question.

In practice in previous years, in order to avoid a proliferation of results for any given year, the newly-calculated parities at the level of total GDP and the main aggregates were replaced with the preliminary estimates. This procedure has now been discontinued.

For 1995, the impact of this change is minimal because the preliminary estimates and the definitive results were calculated in close proximity to one another, so little new information could be incorporated.

For 1996, the impact is more apparent - due in particular to the availability after the preliminary estimates of an

## **RESULTS FOR 1995 AND 1996**

---

improved detailed breakdown of GDP expenditure values.

The parities presented in this publication are now final and will not change. Readers are reminded that National Accounts statistics are regularly revised. Use of these parities to deflate such revised National Accounts figures is acceptable provided that there are not significant changes in the structure of the expenditure values.

## 6. TO KNOW MORE ABOUT...

### 6.1 Data

This publication is the latest in the following sequence of Eurostat publications :

- "World comparisons of Real Gross Domestic Product and Purchasing Power, 1985 (phase V of the ICP)", published in 1994.

## 6.2 Methodology

The methodological information provided in the introductory chapters of the Eurostat publications is only intended to give an overview.

There is now an extensive literature relating to the economic and statistical theory underlying the calculation of purchasing power parities. Much of the similar literature relating to temporal consumer price indices is also relevant to spatial comparisons.

The calculation of purchasing power parities is directly linked to standard national accounting methodologies and in particular to classifications and nomenclatures. The most recent European System of National and Regional Accounts - ESA 1995, (Eurostat, 1996) derives from the United Nations System of National Accounts (1993). This was preceded by ESA 1979.

## **RESULTS FOR 1995 AND 1996**

---

A procedures manual dealing with formulae and computational aspects is currently being drafted by Eurostat. This is intended to complement and extend the handbook of the International Comparison Programme, published by the United Nations (1992). A manual containing detailed guidelines on the methodology of conducting surveys is also being finalised.

( This page intentionally left blank )

**PART TWO:**  
**RESULTS TABLES AND ANALYSIS**

## 7.1 NOTES ON THE RESULTS TABLES

### 7.1.1 Contents summary

The results of the 1995 and 1996 comparisons are presented for GDP and 52 analytical categories. The fourteen tables of results are as follows:

1. Purchasing power parities

(1 PPS = ... units of national currency)

These are basically averages of the price ratios between the countries. They can be used to convert GDP expenditure values expressed in national currency in order to make volume comparisons. The unit in which they are expressed, the PPS (purchasing power standard), is defined in such a way that, for each individual aggregate in the table, the sum of the GDP values for the 15 European Union countries is the same whether expressed in ECU (nominal values) or in PPS (real volumes). This is explained in greater detail in section 5.4.

2. Price level indices

(EU15 = 100)

The table shows the ratio between the purchasing power parities and the exchange rate. This ratio is an indicator of the price level in each country relative to the EU15 average. If the index is higher than 100, the country concerned is relatively expensive, and the use of the exchange rate to convert values expressed in national currency will overestimate volumes. When moving from a relatively cheap country to a relatively expensive country, conversion at market exchange rates reduces purchasing power.

3. Relative price level indices

(GDP = 100)

In this table, the price level indices for each aggregate are expressed in relation to the price level index for total GDP. The results can be used to carry out structural price analyses. For example, if the relative price index for household final consumption expenditure in one country is higher than in another, this suggests that, compared with the whole of economic activity, the prices for household final consumption expenditure are higher in the former country than in the latter.

4. Nominal values in national currency

The values presented here are those available to Eurostat in February 1997 (for the 1995 comparison) and in August 1998 (for the 1996 comparison).

5. Nominal values (%)

This table restates the expenditure values for each country as a percentage of total GDP.

6. Nominal values per capita in national currency

This table shows the expenditure values for each country in national currency in per capita terms.

7. Nominal values in ECU

This table restates the expenditure values in national currency, converted using exchange rates.

8. Nominal values per capita in ECU

This table restates the expenditure values converted using exchange rates in per capita terms.

9. Value indices per capita

(EU15 = 100)

The per capita values in national currency for each aggregate are

converted by means of the exchange rates. The values thus obtained are expressed in relation to the per capita European Union total.

#### 10. Real volumes

This table restates the expenditure values in national currency, converted using PPS, and therefore shows the real volume of economic activity for each aggregate.

#### 11. Real volumes per capita

This table restates the real volumes in per capita terms.

#### 12. Volume indices per capita (EU15 = 100)

The per capita values in national currency for each aggregate are converted by means of the purchasing power parities. The values thus obtained are expressed in relation to the per capita European Union total. These indices should not be used to establish a strict ranking of countries. In fact, the indices only give an indication of the comparative order of magnitude in volume terms of economic activity in each country in relation to others. Thus when comparing the indices for two countries which are similar (for example, 101 and 102 respectively) the conclusion which can be drawn is that GDP per capita in these two countries is of the same order of magnitude.

#### 13. Relative Volume indices (EU15 = 100)

The nominal values in national currency for each aggregate are converted by means of the purchasing power parities and the values thus obtained are expressed in relation to the European Union total. This table gives the real scale of each

country's economic activity in relation to the whole of the European Union.

#### 14. Relative volume indices (GDP = 100)

This table shows the volume indices for each aggregate, expressed in relation to the total GDP volume index. This information can be used to carry out structural analyses. For example, if the index for gross fixed capital formation is 20% higher in one country than in another this suggests that, in real terms, the second country invests 20% less than the first.

### 7.1.2 A worked example

Germany :- 1996, at GDP level		
Narrative	Ref	Value
Nominal expenditure in DM-	4	3 541 500
Purchasing power standard	1	2.198
⇒ Real volume	10	1 611 070
Population	7.2	81 895
⇒ Real volume per capita	11	19 672
EU15 average	11	18 113
⇒ Per capita volume index	12	109

### 7.1.3 Interpreting the tables

Tables 1 to 3 and tables 10 to 14 must be read horizontally. Comparison of the figures for the same country (vertical reading) in these tables is meaningless. This is because purchasing power parities are calculated using a formula which is not additive (this is considered to be a minor trade-off given the more important axiomatic requirements which the chosen formula does fulfil).

The detailed results are presented here in accordance with two classifications, ICP and SNA. The reader is reminded that the ICP classification puts the emphasis on the consumption of goods and services by including all individual services (education, health, culture, social security, welfare) in the actual individual final consumption. Consequently, the volume comparison of goods and services obtained in accordance with the ICP classification is more significant than that obtained in accordance with the SNA classification, which puts the emphasis on expenditure. The advantage of the SNA classification is that it makes it possible to observe the intervention of the public sphere in various sectors of the economy.

Simultaneous temporal and spatial consistency is a goal which is difficult to achieve in practice (there is an ongoing theoretical debate about the possibility). The purchasing power parities presented in this document were not designed with this objective in mind. Rather, they are intended to give the best possible estimate of spatial relativities at a particular point in time. In consequence, comparisons between different time periods (eg. 1995/1996) are difficult due to changes in data and changes (improvements) in methods.

The 1996 results are generally felt to be of better quality than the 1995 results. In particular, there has been an improvement in the calculation of rents parities (methods and data sources) and in the accuracy of the detailed breakdown of GDP which is used for aggregation purposes.

The starting point for the volume comparisons is the expenditure in national currency in each country for the classification used. The comparability of the treatment of these values in the countries' national accounts determines the comparability of the volume results of the comparison. Thus, some countries include expenditure on alcoholic beverages consumed in restaurants, cafes and hotels under the item "alcoholic beverages" of the heading "food", whereas others include them under the item "restaurants, cafes and hotels", as stipulated in the ESA. Certain countries in the former group have made adjustments in order to improve the comparability of the data, but the differences in treatment have not been eliminated completely.

There may still be other inconsistencies between the countries in the treatment of certain categories of expenditure. However, it is considered that the level of reliability of the overall data is still reasonable.

Final consumption expenditure consists of expenditure incurred by resident institutional units on goods or services that are used for the direct satisfaction of individual or collective needs of members of the community. However, final consumption expenditure may take place on the domestic territory or abroad.

The breakdown of household final consumption expenditure is only available in all the countries according to the domestic concept, and this can be recalculated according to the national concept at global level via the "net expenditure abroad" balance.

## **RESULTS FOR 1995 AND 1996**

---

Thus, certain specific situations in different countries may explain results that appear anomalous. For example, in the case of Luxembourg the value and volume data for the item "tobacco", that seem to be unusually high, are due to purchases by non-residents.

2. REAL VOLUMES: % SHARE OF EU15 TOTAL GDP FOR 1995

3. COMPARISON OF 1995 PER CAPITA VALUE / VOLUME INDICES AT THE LEVEL OF TOTAL GDP

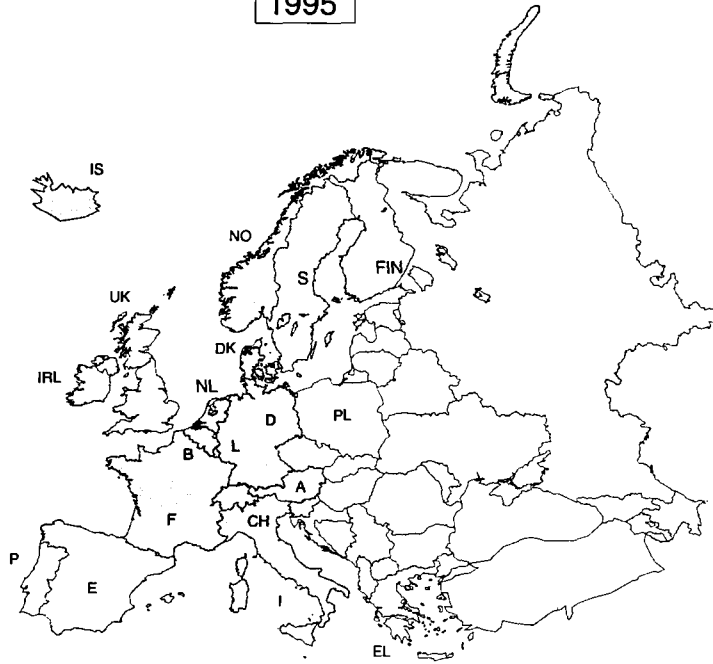

**NOTE**

These indices are not sufficiently precise to establish a strict ranking of countries. Thus when comparing the indices for two countries which are similar (for example, 101 and 102 respectively) the conclusion which can be drawn is that GDP per capita in these two countries is of the same order of magnitude.

5. Map showing GDP expenditure volume per capita

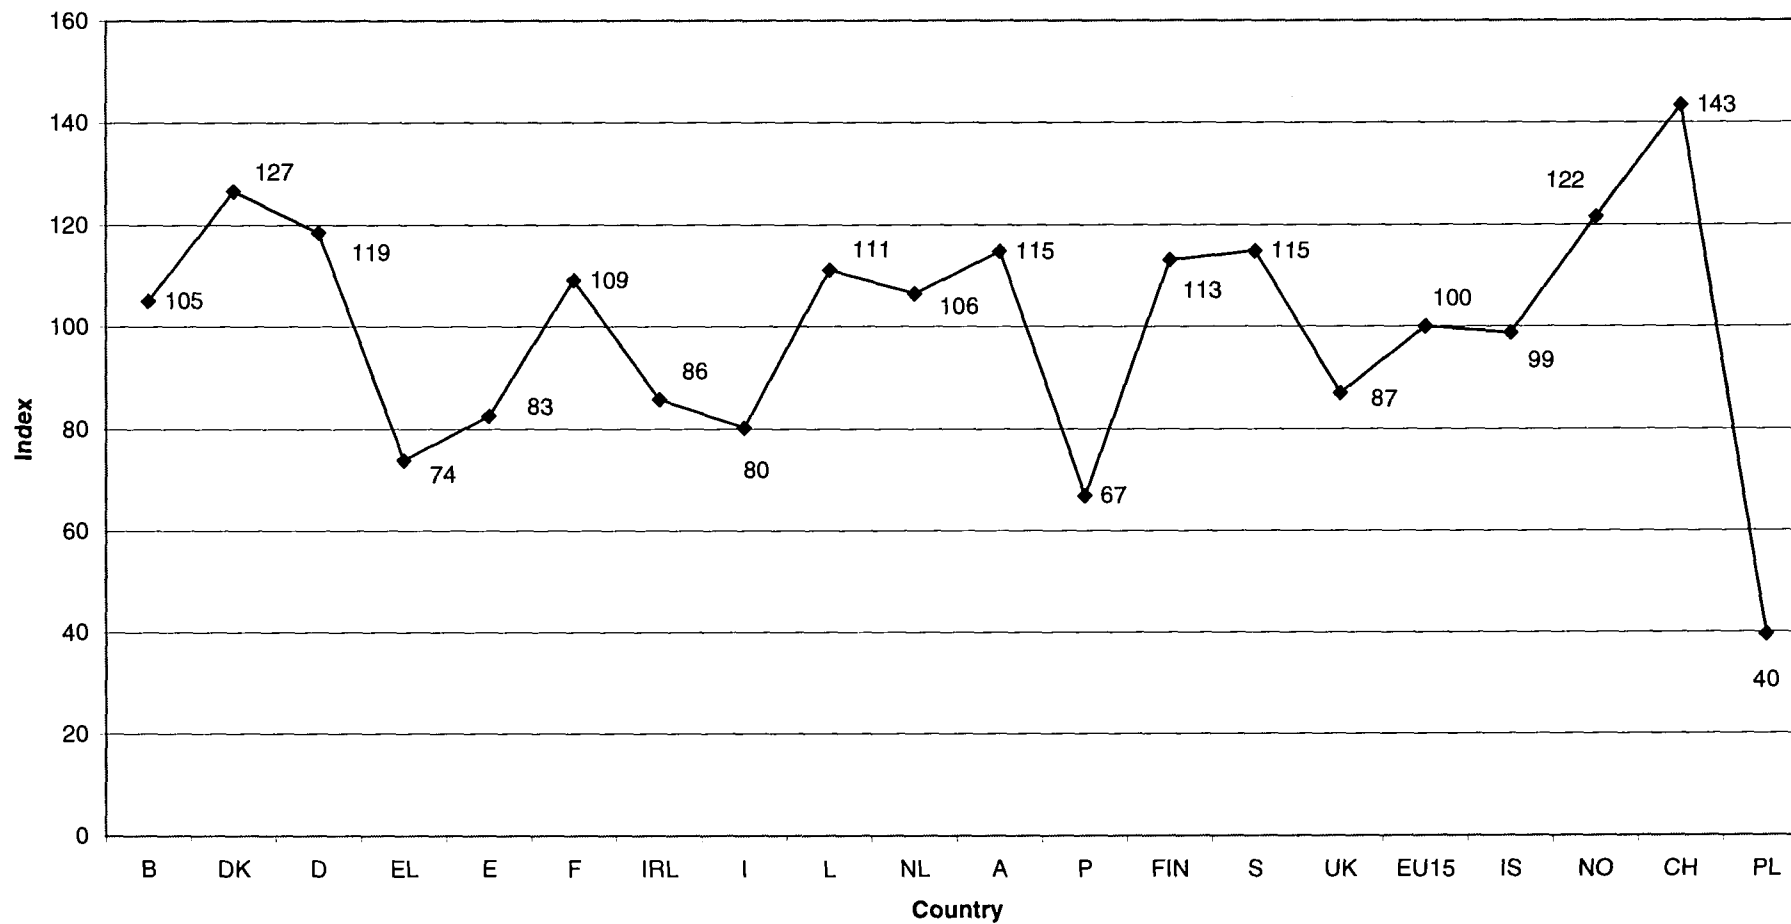

1995

GDP expenditure volume per capita  
(in pps)

- 23.300 to 29.200 (1)
- 17.500 to 23.300 (10)
- 11.700 to 17.500 (5)
- 5.900 to 11.700 (3)

6. GRAPH OF 1995 PRICE LEVEL INDICES (EU15 = 100) AT THE LEVEL OF TOTAL GDP

## 1995: ICP classification

1. **Purchasing power parities  
(1 PPS = ??? national currency)**
2. **Price level indices (EU15 = 100)**
3. **Relative price level indices (GDP = 100)**
4. **Nominal expenditure values in national currency**
5. **Nominal expenditure values (%)**
6. **Nominal expenditure values per capita in national  
currency**
7. **Nominal expenditure values in ECU**
8. **Nominal expenditure values per capita in ECU**
9. **Value indices per capita (EU15=100)**
10. **Real expenditure volumes**
11. **Real expenditure volumes per capita**
12. **Volume indices per capita (EU15=100)**
13. **Relative volume indices (EU15=100)**
14. **Relative volume indices (GDP=100)**

# RESULTS FOR 1996

( This page intentionally left blank )

## **1996: Analytical aids**

- 1. One-page summary: results at GDP level**
- 2. Real volumes: % share of EU15 total**
- 3. Comparison of per capita value and volume indices**
- 4. Ranking of countries by per capita volume indices**
- 5. Map showing GDP volume per capita**
- 6. Graph of price level indices**

## 1. ONE PAGE SUMMARY : RESULTS AT GDP LEVEL

	B	DK	D	EL	E	F	IRL
1 PURCHASING POWER PARITIES (1 PPS = ??? NATIONAL CURRENCY)	39,93	9,03	2,198	231,9	134,1	7,125	0,7292
EXCHANGE RATES (1 ECU = ??? NATIONAL CURRENCY)	39,30	7,36	1,910	305,5	160,7	6,493	0,7934
2 PRICE LEVEL INDICES (EU15 = 100)	102	123	115	76	83	110	92
POPULATION	10.157	5.262	81.895	10.465	39.270	58.375	3.600
4 NOMINAL EXPENDITURE VALUES IN NATIONAL CURRENCY	8.304.998	1.013.928	3.541.500	29.594.554	74.081.796	7.822.243	44.192
7 NOMINAL EXPENDITURE VALUES IN ECU	211.331	137.774	1.854.635	96.858	460.857	1.204.719	55.696
10 REAL EXPENDITURE VOLUMES	208.010	112.291	1.611.070	127.605	552.435	1.097.791	60.604
6 NOMINAL EXPENDITURE VALUES PER CAPITA IN NATIONAL CURRENCY	817.662	192.707	43.244	2.827.928	1.886.459	134.000	12.275
8 NOMINAL EXPENDITURE VALUES PER CAPITA IN ECU	20.806	26.185	22.646	9.255	11.736	20.638	15.471
11 REAL EXPENDITURE VOLUMES PER CAPITA	20.479	21.342	19.672	12.193	14.068	18.806	16.834
9 VALUE INDICES PER CAPITA (EU15 = 100)	115	145	125	51	65	114	85
12 VOLUME INDICES PER CAPITA (EU15 = 100)	113	118	109	67	78	104	93
13 RELATIVE VOLUME INDICES (EU15 = 100)	3,07	1,66	23,8	1,88	8,15	16,2	0,894

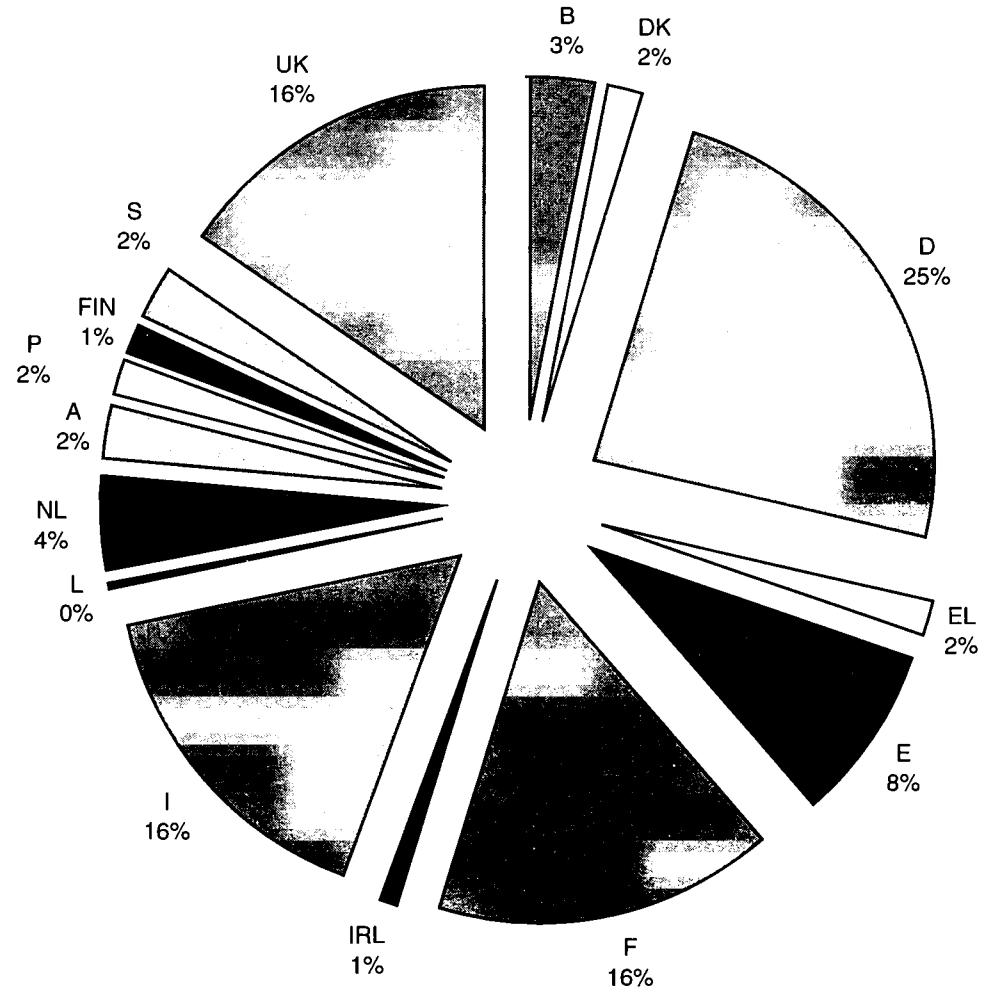

Note: Extracts from tables 3, 5 and 14 are not included here because the figures in those tables are expressed relative to total GDP for each country (ie. GDP=100)

RESULTS FOR 1995 AND 1996

												1996
I	L	NL	A	P	FIN	S	UK	EU15	IS	NO	CH	PL
1716	43,05	2,217	14,72	132,7	6,382	10,49	0,6983	1	83,22	9,88	2,225	1,480

16,1	0,180	4,44	2,43	1,87	1,33	2,40	15,6	100,0	0,0859	1,52	2,41	3,62

2. REAL VOLUMES: % SHARE OF EU15 TOTAL GDP FOR 1996

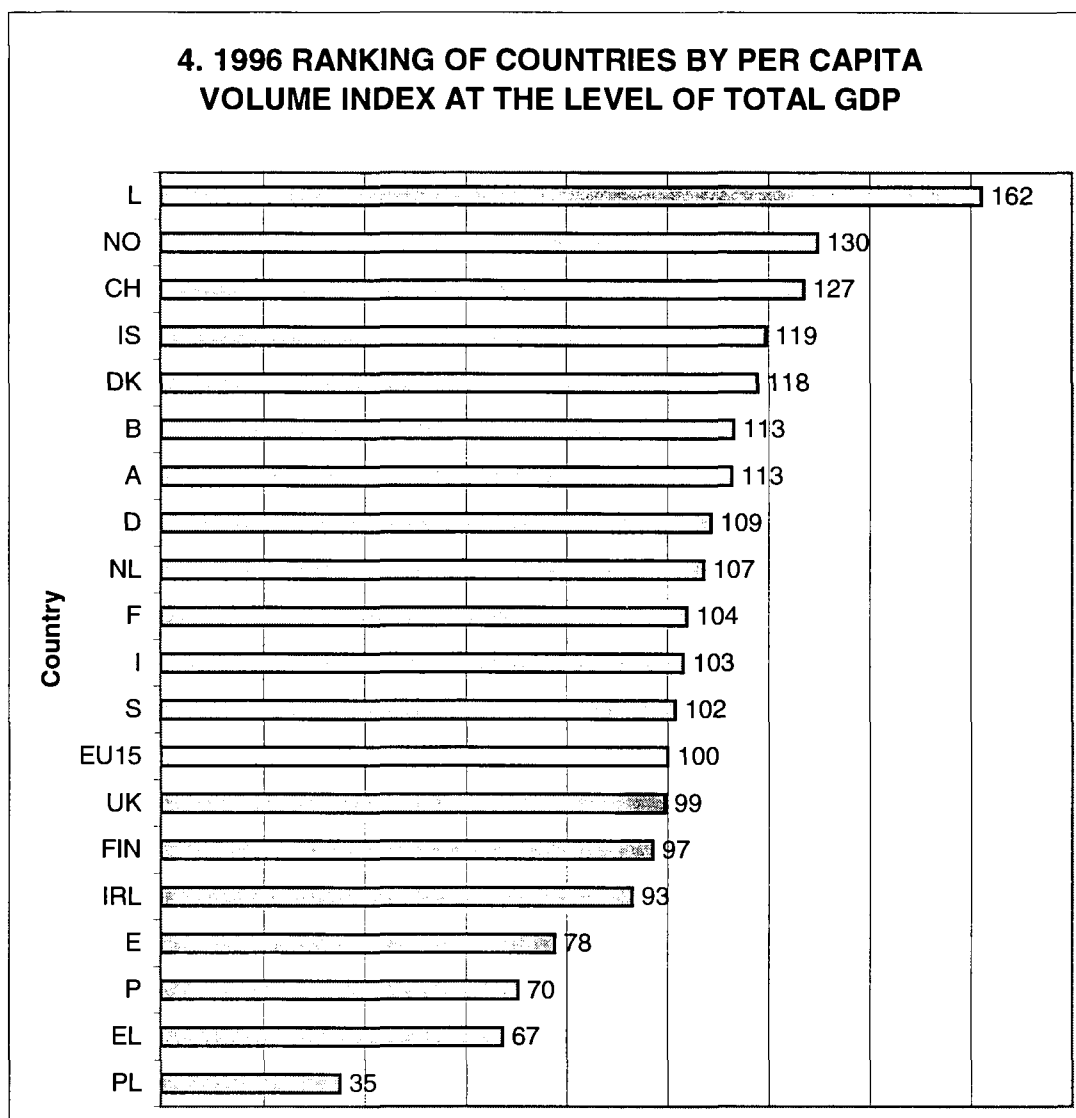

3. COMPARISON OF 1996 PER CAPITA VALUE / VOLUME INDICES AT THE LEVEL OF TOTAL GDP

#### 4. 1996 RANKING OF COUNTRIES BY PER CAPITA VOLUME INDEX AT THE LEVEL OF TOTAL GDP

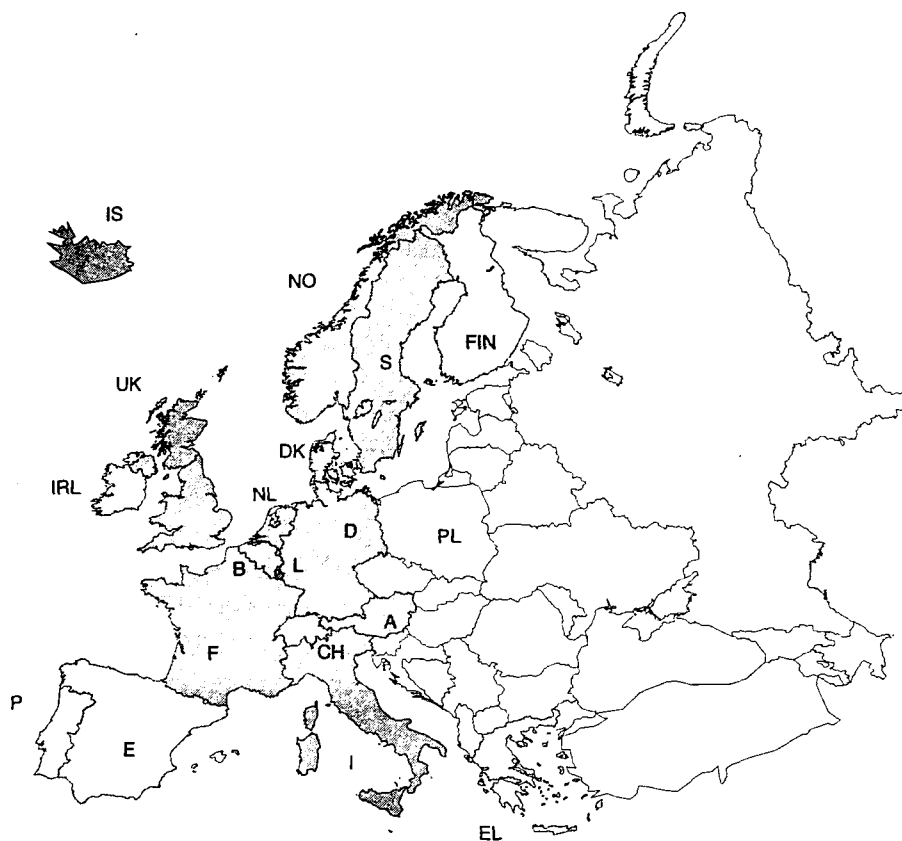

#### NOTE

These indices are not sufficiently precise to establish a strict ranking of countries. Thus when comparing the indices for two countries which are similar (for example, 101 and 102 respectively) the conclusion which can be drawn is that GDP per capita in these two countries is of the same order of magnitude.

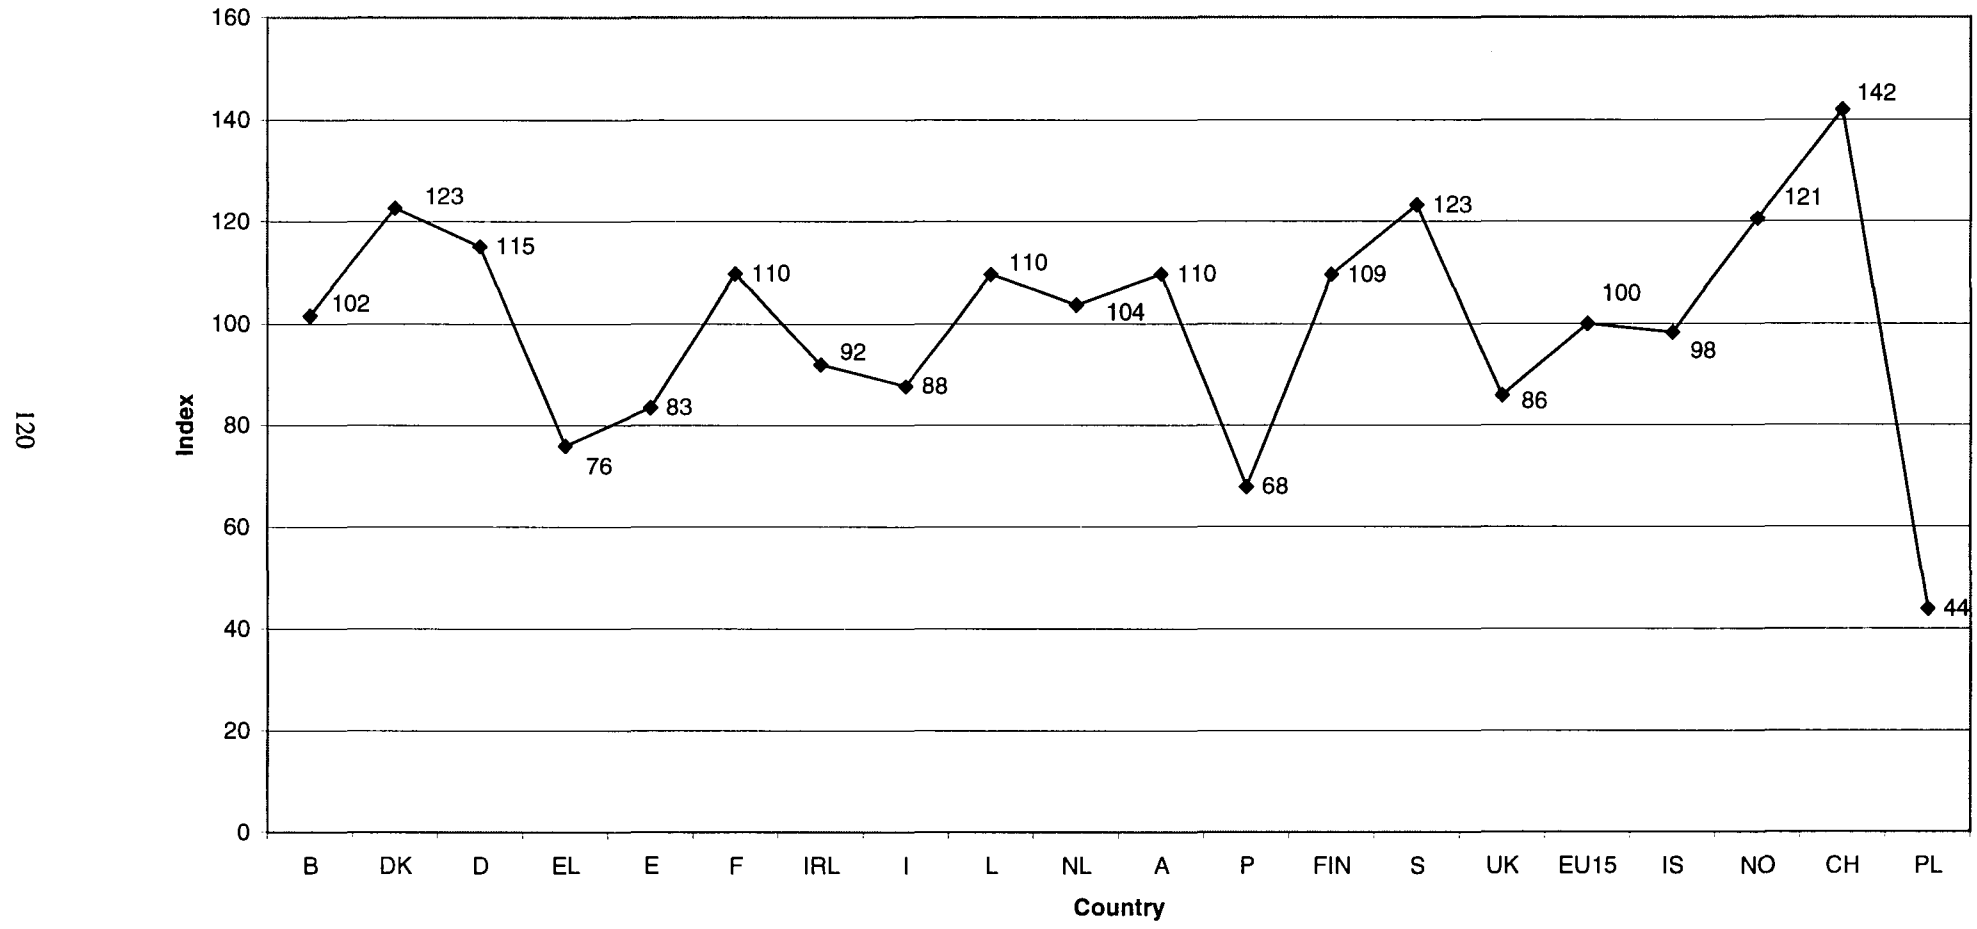

5. Map showing GDP expenditure volume per capita

1996

GDP expenditure volume per capita (in PPS)	
■	23.700 to 29.400 (1)
▒	17.900 to 23.700 (12)
□	12.100 to 17.900 (5)
□	6.300 to 12.100 (1)

6. GRAPH OF 1996 PRICE LEVEL INDICES (EU15=100) AT THE LEVEL OF TOTAL GDP

( This page intentionally left blank )

( This page intentionally left blank )

## 1996: SNA classification

1. **Purchasing power parities  
(1 PPS = ??? national currency)**
2. **Price level indices (EU15 = 100)**
3. **Relative price level indices (GDP = 100)**
4. **Nominal expenditure values in national currency**
5. **Nominal expenditure values (%)**
6. **Nominal expenditure values per capita in national  
currency**
7. **Nominal expenditure values in ECU**
8. **Nominal expenditure values per capita in ECU**
9. **Value indices per capita (EU15=100)**
10. **Real expenditure volumes**
11. **Real expenditure volumes per capita**
12. **Volume indices per capita (EU15=100)**
13. **Relative volume indices (EU15=100)**
14. **Relative volume indices (GDP=100)**

## 1996: ICP classification

1. Purchasing power parities  
(1 PPS = ??? national currency)
2. Price level indices (EU15 = 100)
3. Relative price level indices (GDP = 100)
4. Nominal expenditure values in national currency
5. Nominal expenditure values (%)
6. Nominal expenditure values per capita in national currency
7. Nominal expenditure values in ECU
8. Nominal expenditure values per capita in ECU
9. Value indices per capita (EU15=100)
10. Real expenditure volumes
11. Real expenditure volumes per capita
12. Volume indices per capita (EU15=100)
13. Relative volume indices (EU15=100)
14. Relative volume indices (GDP=100)
