Research
and development

..... Our mission is to provide the European Union with a high-quality statistical information service

Eurostat's collections are adapted to the needs of all users.
You will find them in each of the nine themes proposed by Eurostat.

1 General statistics

2 Economy and finance

3 Population and social conditions

4 Industry, trade and services

5 Agriculture and fisheries

6 External trade

7 Transport

8 Environment and energy

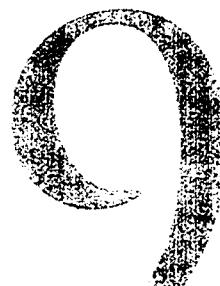

9 Research and development

	Content	Format
Press releases: Eurostat publishes around 100 press releases every year in connection with the release of new data. The press releases include the key figures on the EU, the Member States and their partners. They are provided free of charge. They are also available on the Internet as soon as they are published: http://europa.eu.int/eurostat.html	 	Paper Html PDF
Statistics in focus: This collection is published regularly by Eurostat and provides up-to-date summaries of the main results of statistical surveys, studies and analyses. It covers all themes and consists of about four to eight pages per issue. Eurostat issues around 150 <i>Statistics in Focus</i> per year. Available as single copies or on subscription.	 	Paper PDF
Key indicators: This collection provides the main indicators on a theme or sub-theme in an easy-to-carry booklet of up to 100 pages. Available as single copies or on subscription.	 	Paper Html
Panorama of the European Union: This collection highlights the features and trends of a multi-sectoral theme or a sectoral sub-theme. The publications consist of around 200 pages and include analysis as well as tables and graphs. Available as single copies or on subscription.	 	Paper CD-ROM
Methods and nomenclatures are intended for specialists who want to consult the methodologies and nomenclatures used for a theme, a sub-theme or a sector. Available as single copies.	 	Paper CD-ROM
Detailed tables are intended for specialists. They present part, or all, of the statistical data compiled on a theme, sub-theme or sector. Available as single copies or on subscription.	 	Paper CD-ROM
Studies and research summarise the results of European statistical studies and research and are intended for specialists. Available as single copies or on subscription.	 	Paper CD-ROM
Catalogues provide rapid access to concise information on Eurostat's products and services. They are free of charge and include the <i>Mini guide</i> , a selection of Eurostat products and services, and <i>Statistical references</i> , the quarterly newsletter on Eurostat's latest products and services. Eurostat Data Shops:

A personalised data retrieval service

In order to provide the greatest possible number of people with access to high-quality statistical information, Eurostat has developed an extensive network of Data Shops (').

Data Shops provide a wide range of **tailor-made services**:

- ★ immediate information searches undertaken by a team of experts in European statistics;
- ★ rapid and personalised response that takes account of the specified search requirements and intended use;
- ★ a choice of data carrier depending on the type of information required.

Information can be requested by phone, mail, fax or e-mail.

(') See list of Eurostat Data Shops at the end of the publication.

Internet:

Essentials on Community statistical news

- ★ Euro indicators: more than 100 indicators on the euro-zone; harmonized, comparable, and free of charge;
- ★ About Eurostat: what it does and how it works;
- ★ Products and databases: a detailed description of what Eurostat has to offer;
- ★ Indicators on the European Union: Convergence criteria; euro yield curve and further main indicators on the European Union at your disposal;
- ★ Press releases: direct access to all Eurostat press releases.

For further information, visit us on the Internet at: <http://europa.eu.int/eurostat.html>

A great deal of additional information on the European Union is available on the Internet.
It can be accessed through the Europa server (<http://europa.eu.int>).

Cataloguing data can be found at the end of this publication.

Eurostat is the Statistical Office of the European Communities. Its task is to provide the European Union with statistics at a European level, that allow comparisons to be made between countries and regions. Eurostat consolidates and harmonizes the data collected by the Member States.

To ensure that the vast quantity of accessible data is made widely available, and to help each user make proper use of the information, Eurostat has set up a publications and services programme.

This programme makes a clear distinction between general and specialist users and particular collections have been developed for these different groups. The collections *Press releases*, *Statistics in focus*, *Panorama of the European Union*, *Key indicators* and *Catalogues* are aimed at general users. They give immediate key information through analyses, tables, graphs and maps.

The collections *Methods and nomenclatures*, *Detailed tables* and *Studies and research* suit the needs of the specialist who is prepared to spend more time analysing and using very detailed information and tables.

All Eurostat products are disseminated through the Data Shop network or the sales agents of the Office for Official Publications of the European Communities. Data Shops are available in 12 of the 15 Member States as well as in Switzerland, Norway and the United States. They provide a wide range of services from simple database extracts to tailor-made investigations. The information is provided on paper and/or in electronic form via e-mail, on diskette or CD-ROM.

As part of the new programme Eurostat has developed its website. It includes a broad range of on-line information on Eurostat products and services, newsletters, catalogues, on-line publications as well as indicators on the euro-zone.

Director-General**

RESEARCH AND DEVELOPMENT:

ANNUAL STATISTICS 1999

FOREWORD

The publication ***Research and Development: Annual Statistics 1999*** contains up-to-date statistics on R&D and on patent applications in the European Union and the EEA. These statistics show the trends and structure of research and development in the EEA.

Continuing our efforts to improve the quality of the annual publication, for the 1999 edition, we have decided to reorganise the contents of the publication by topic (e.g. all the information regarding GBAORD are now located in the GBAORD chapter). This follows on from internal discussion at Eurostat and various comments from our readers. In this way, it is hoped that this more concise publication will be easier for the user to find their way around.

Other major changes have concentrated on improving the dissemination of the R&D and patent statistics to reach as wide an audience as possible. Hence we have decided to disseminate these statistics via this paper version, a CD-ROM and supplemented by "Statistics in Focus" on specific topics. The paper version of the publication will include data at NUTS level 1, methodological notes and brief analysis; whereas the CD-ROM will provide detailed data (data to NUTS level 3 and complete time series) with methodological notes. The Statistics in Focus, on the other hand, will concentrate on providing readers with a more detailed analysis of the R&D situation within the EEA.

We hope that this new edition serves our users well, both within the policy making and scientific communities and the public at large, and that these changes will be welcomed. If you have any comments to make on this publication, further suggestions for improvement or so on, please do not hesitate to contact Unit A4 "Research and development, methods and data analysis" of Eurostat.

All the information in this publication is based on data supplied to Eurostat by the Member States, by DG XII-02 (Science, Research and Development - Competitiveness, Economic Analysis and Indicators Unit) of the European Commission, by the European Patent Office (EPO) and by the OECD. We should like to express our thanks to our colleagues in the Member States (and in Iceland and Norway), the Commission Services, EPO and the OECD for their excellent co-operation and their willingness to help meet the ever-growing demand for information on R&D.

The team that prepared this publication consisted of: César de Diego Díez, Véronique de Känel, Moss Khan, Ibrahim Laafia, George Paterson, Frédéric Riehl, Martin Schaaper and Nancy Thomas.

EXECUTIVE SUMMARY

Research and Development (R&D) is regarded as an important contribution to our well-being; it is a driving factor behind economic growth and job creation, a source of increasing quality of products and a prime mover of improvements in health care and environmental protection. For the development of the European Union, its Member States and regions, R&D is therefore a key issue. This is why political decision-makers at all levels are calling for stronger measures in support of R&D.

Putting such measures into practice requires, among other things, data which are as comprehensive, comparable and as up to date as possible. This publication, by the Statistical Office of the European Communities (Eurostat), attempts to meet the European-wide demand for such data, providing regional data as far as possible for four key R&D statistical indicators - government R&D appropriations, R&D expenditure, R&D personnel and European patent applications.

Government R&D appropriations are an important indicator of R&D trends. In 1997, budget appropriations in the Member States of the European Economic Area totalled more than ECU 57,600 million, with a further ECU 2,600 million earmarked by the European Commission. This amount is in real terms similar to the past three years, and provisional figures for 1998 suggest around the same.

As far as R&D expenditure is concerned, in 1997, approximately ECU 137,700 million was spent in the European Union, an estimated increase of 4.6% (and 2.3% in real terms) on 1996. This figure is equivalent to about 1.9% of the EU's gross domestic product, but well below the corresponding figures for the United States and Japan. More than 60% was accounted for by the business enterprise sector, and the rest by the government and higher education sectors in roughly equal proportions.

Apart from adequate funding, successful R&D activities require the deployment of qualified staff. In 1997, in the European Union there were over 2.1 million scientists (1 601 900 FTE), technicians and other R&D-related personnel, most of them in the business enterprise sector. This figure continues a steady gradual increase seen this decade. Provisional figures suggest a further increase in 1998. R&D personnel make up approximately 1.27% of the entire EU labour force.

Patent data have long been used as a measure of innovative activity, technology development, and particularly for international comparisons of technology growth. Since 1990, the EU-15 patent applications have grown at an average annual rate of 2.7% and in 1998, just over 40,000 patent applications were filed by the EU-15. Germany, France and UK are the three dominant countries in EU patenting and in 1998 they accounted for around 70% of the EU total.

DEFINITIONS AND EXPLANATORY NOTES

The standards used

The basic methodological recommendations for R&D statistics are given in the "Proposed Standard Practice for Surveys of Research and Experimental Development – Frascati Manual" (OECD, 1994). This manual deals exclusively with the measurement of R&D "input". The regional aspects of R&D and innovation statistics are covered by "The Regional Dimension of R&D and Innovation Statistics – Regional Manual" (Eurostat, 1996). The following definitions are mainly derived from these manuals. In principle, the R&D data in this publication are being collected in line with these recommendations. The basic data are collected by the relevant authorities in the MS (National Statistical Offices, Research Councils, Ministries for R&D). These data are transmitted to Eurostat where the data are checked, transformed, and where the derived indicators are calculated.

Research and Development – R&D

Research and experimental development (R&D) comprise creative work undertaken on a systematic basis in order to increase the stock of knowledge, including knowledge of man, culture and society and the use of this stock of knowledge to devise new applications (Frascati Manual, § 57). This term covers three activities: basic research; applied research, and experimental development.

Measures for R&D input

According to the recommendations of the Frascati Manual and the Regional Manual, the following indicators for R&D input are compiled in this publication:

- *Government budget appropriations or outlays on R&D – GBAORD*
GBAORD means all appropriations by central government allocated to R&D in central government budgets. Data on government R&D appropriations therefore refer to budget provisions, not to actual expenditure, i.e. GBAORD measures government support for R&D using data collected from budgets.
- *R&D expenditure*
The basic measure for R&D expenditure is the "intramural expenditures", which are all expenditures for R&D performed within a statistical unit or sector of the economy, whatever the source of funds (Frascati Manual, § 335).
- *R&D personnel*
R&D personnel data measure the amount of resources going *directly* into R&D activities. This includes all persons employed directly in R&D plus persons supplying direct services to R&D, such as managers, administrative staff and office staff (Frascati Manual § 279).

GBAORD

As a departure from the general rule, the provisional budget figures are converted from national currency into ECU on the basis of the exchange rates in March of the year in question.

Figures in ECU at current prices

The average rates of exchange for the year in question are used for converting absolute values from national currencies into ECU.

Figures in 1990 PPS at constant prices

Since disparate price trends in the countries under consideration make inter-country comparisons of monetary aggregates at current prices unreliable, the absolute figures are also expressed in constant prices. The implicit GDP price index, obtained by dividing GDP at market prices expressed at current values by GDP at market prices expressed in 1990 constant prices, is used as a deflator. This price index is thus of the Paasche type, and it enables the deflated monetary aggregates to be directly compared.

Financial aggregates in different countries are not even fully comparable after deflation and conversion to ECU, since exchange rates are influenced not only by disparate price trends but also by other factors, and this may distort any comparisons based on those rates. Purchasing power parities, based on comparisons of the prices of representative and comparable goods or services in different countries in different currencies on a specific date, are used to eliminate such effects. As a result, financial aggregates are expressed in purchasing power standards (PPS) rather than ECU based on exchange rates. The calculations in this publication are based on 1990 purchasing power standards.

Central government

Central government is a sub-sector of the general government sector of the national accounts. According to the European System of Accounts (ESA, Eurostat 1995), the general government sector includes all institutional units which are principally engaged in the production of non-market services intended for individual and collective consumption and/or the redistribution of national income and wealth. The sub-sector central government is restricted to all administrative departments of the State and other central agencies whose competence extends over the whole economic territory (except the administration of social security funds). In Germany this sub-sector includes the central governments of the *Länder*.

Central government budget

The central government budget (CGB) comprises current and capital expenditure by central government. Eurostat extracts the CGB data from the harmonised results of the ESA. No data are available for Greece.

Region

The regional breakdown of the Member States of the EU is based on the NUTS (Nomenclature of Territorial Units for Statistics, Eurostat, 1995) classification. The NUTS 1995 classification was revised in 1998 (Nomenclature of Territorial Units for Statistics, Eurostat, 1998) but due to time constraint we have been unable to take this into account. However it is envisaged that in next years publication the latest version of NUTS classification will be taken into consideration. The NUTS are at three levels, not all of which are represented in every Member State: Denmark and Ireland, for example, have no NUTS 1 or NUTS 2 regions, which means that these two levels are identical to the countries themselves.

Gross domestic product (GDP) at market prices

This aggregate represents the result of the production activity of resident producer units. It corresponds to the economy's output of goods and services, less intermediate consumption, plus taxes linked to imports. The sum of the regional values of the GDP at market prices might differ from the national values for some countries.

Labour force

The labour force comprises all people aged 15 and over who are employed or unemployed but not inactive (pupils, students, people in compulsory military service, retired people).

Population

The population figures are estimates, harmonised by Eurostat, of mean population over the year.

PART A:

RESEARCH AND DEVELOPMENT IN EUROPE

CHAPTER 1: Government Budget Appropriations on R&D - GBAORD

Introductory remark

There are two ways of measuring government support for R&D. The most accurate way is to hold surveys in order to identify the amount actually spent on R&D over the previous year and the share which was financed by the government. However, data from this method do not become available until several years after the R&D has been carried out. Hence a second method of measuring government support for R&D has been devised, using data collected from the budgets. Budget based data are referred to as government budget appropriations or outlays for R&D (GBAORD).

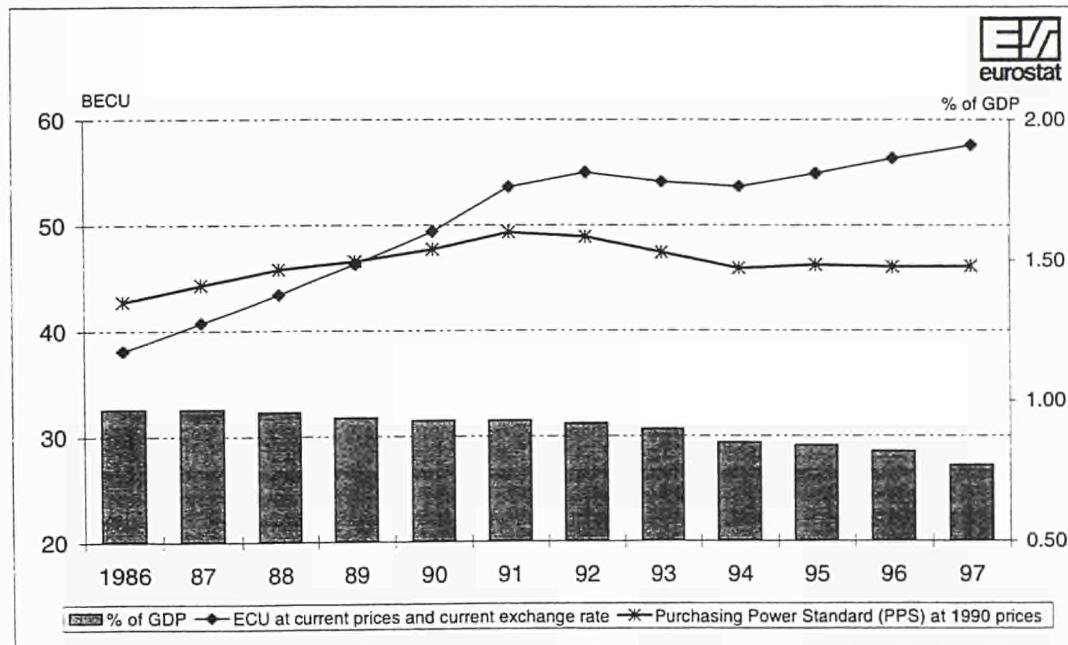

GBAORD means all appropriations by central government allocated to R&D in central government budgets. Data on government R&D appropriations therefore refer to budget provisions, not to actual expenditure, i.e. GBAORD measures government support for R&D using data collected from budgets. The figures on actual expenditure, which are not available in their final form until some time after the end of the budget year concerned, may well differ from the original budget provisions.

Despite all efforts, the concepts and methods used by the individual Member States of the EEA, the United States of America and Japan for collecting data on government R&D appropriations are not completely harmonised. One methodological discrepancy lies in the treatment of transfers of funds for R&D purposes by the European Commission to the Member States in the context of the Community Support Framework (CSF).

1.1. GBAORD ALLOCATION IN THE EEA

Funds allocated by the EEA governments towards R&D activities increased substantially in the late 80's. However, since then it has remained more or less constant. Between 1986-92, GBAORD in the EEA increased at an annual average growth rate of 6.3%, whereas the growth rate between 1992-97 was a mere 0.8%. In terms of current ECU, EEA governments allocated 57.6 BECU towards R&D activities in 1997, representing a 1.5 fold increase on the 1986 level.

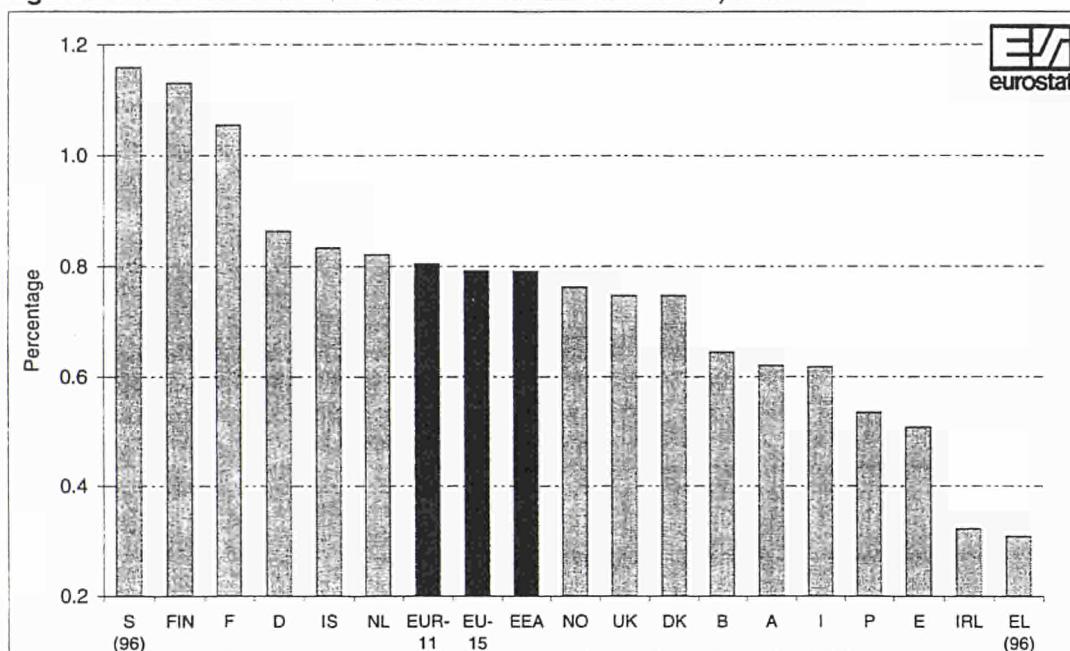

Figure 1 : Trends in GBAORD of the EEA, 1986-97

However, in constant (PPS) prices, GBAORD of the EEA governments increased steadily and reached a peak in 1991, but since then it has continuously declined. In constant (PPS) prices, funds allocated by EEA governments towards R&D increased by 2.9% annually between 1986-91, since then it has been decreasing at an annual rate of 1.1% between 1991-97. GBAORD as a proportion of GDP shows a similar trend for the 1986-97 period. The budgets allocated for the R&D activities as a proportion of GDP by the EEA governments have consistently declined; in 1986 1.0% of the EEA GDP was allocated for R&D activities but by 1997 the ratio had declined to 0.8% (figure 1).

Aggregate GBAORD data of the EEA hides the existence of the disparities between the EEA countries. There are in fact major differences in the allocation of funds towards R&D activities within the Member States. Expressing GBAORD as a proportion of GDP reveals that Sweden, Finland and France clearly stands out from the rest of the EEA countries. They allocated more than 1% of their respective GDP towards R&D activities in 1997, which is far above the EEA average (0.8%). At the other extreme, the four southern EU Member States plus Ireland allocated between 0.6% and 0.3% of their respective GDP towards R&D activities in 1997 (figure 2).

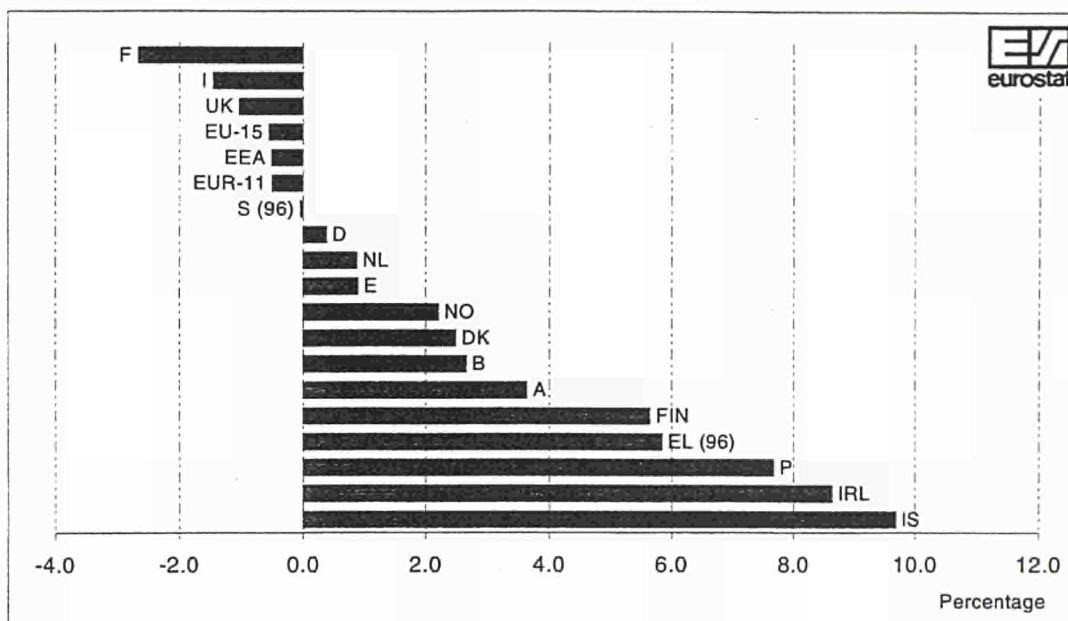

Figure 2 : GBAORD as a % of GDP of the EEA countries, 1997

Long term trends show that the funds allocated towards R&D activities (GBAORD as a % GDP) by the governments of the large four EEA countries have declined substantially during the 1986-97 period, whereas the smaller EEA countries increased their allocation of funds towards R&D activities. In 1986 the United Kingdom government allocated 1.1% of its GDP towards R&D activities, however by 1997 this figure has declined to 0.75%. The Finnish government on the other hand increased its allocation of funds towards R&D activities from 0.7% in 1986 to 1.1% by 1997.

The largest increase in the allocation of funds towards the R&D activities devoted by the government is recorded for Iceland followed by Ireland, Portugal, and Greece. This is in contrast to the allocation of funds towards R&D activities by the governments of Italy, France and the United Kingdom, all of which have allocated fewer funds in 1997 than in 1990. GBOARD for Iceland and Ireland increased at an average annual growth rate of 9.7% and 8.7% (based on 1990 PPS data) between 1990-97, whereas the Italian and French GBOARD declined by 1.5% and 2.7% (per annum) during the same period (figure 3).

Figure 3 : Growth rate of GBAORD, 1990-97 (1990 PPS)

1.2. GBAORD ALLOCATION BY SOCIO-ECONOMIC OBJECTIVES

The aim of the classifying GBAORD by socio-economic objectives is to aid policy makers in the formulation of science and technology policy. Government R&D appropriations are broken down by socio-economic objectives on the basis of NABS (Nomenclature for the Analysis and Comparison of Scientific Programmes and Budgets, Eurostat 1994).¹ Analysis of the disaggregated data reveals the priorities placed by individual governments in different categories.

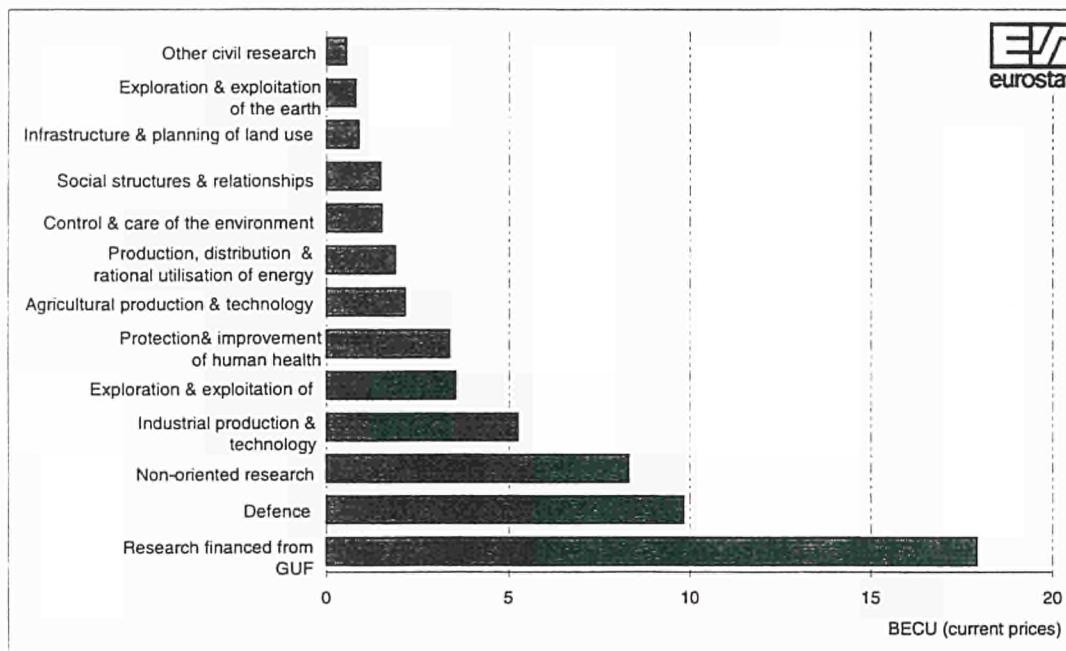

Figure 4 shows the breakdown of R&D appropriations of the EEA governments taken together. The largest share of R&D funds allocated by the EEA governments were for the Government University Fund (GUF) category, followed by Defence and Non-Oriented Research. In 1997, 17.9 BECU was allocated for the GUF category, representing 31% of the total EEA GBAORD, whereas the Defence and Non-Oriented Research categories accounted for 17% and 14.5% of the total EEA GBAORD.

Since the early 90s the EEA governments have placed greater emphasis on the GUF category at the expense of the defence category. R&D funds allocated to defence related research declined from 23% in 1990 to 17% in 1997; in contrast, R&D funds allocated to GUF increased from 24% in 1990 to 31% in 1997. Other significant changes in the allocation of funds are observed for the Industrial Production and Technology category, which accounted for 9% of the total EEA GBAORD in 1997, a decline of 4% points from 1990.

¹ The 1983 version of NABS applies to all the figures up until the 1992 final budgets and the 1993 provisional budgets. The 1993 version applies from the 1993 final and the 1994 provisional budgets onwards. As a result of the revision of NABS, the data for some 1- and 2-digit NABS headings cannot really be compared with those in earlier publications. The greatest differences are to be found in chapters 1, 3, 5, 7, 10 and 11 of NABS. Not all countries collect the data directly by NABS but by other compatible classifications (OECD, NORDFORSK), which are then converted to NABS classification. Some countries have difficulty in allocating government R&D appropriations to some NABS sub-chapters, which undermines the comparability of results at sub-chapter level. This concerns, among others, the sub-chapters "General Research", which may also include R&D appropriations which according to their content belong to other sub-chapters but which for one reason or another are allocated to the sub-chapters "General Research". Furthermore, the sums of the figures at sub-chapter level do not always agree with the figures at chapter level. One possible explanation for underestimates, where the sum of the R&D budget provisions in the sub-chapters shown is less than the value at chapter level, is that not all of the R&D budget provisions of a chapter can be allocated to the sub-chapters.

There are wide variations in the emphasis placed by the governments of the individual EEA countries on the NABS categories. The majority of the EEA countries allocated the largest share of GBAORD to the GUF category in 1997. France and the United Kingdom on the other hand allocated the largest share to the Defence category (28% and 39% respectively). Ireland and Finland placed more emphasis on Industrial Production and Technology; in 1997 the Irish and the Finnish governments allocated 34% and 27% respectively of their total GBAORD to this category.

Figure 4 : EEA GBAORD by socio-economic objective, 1997

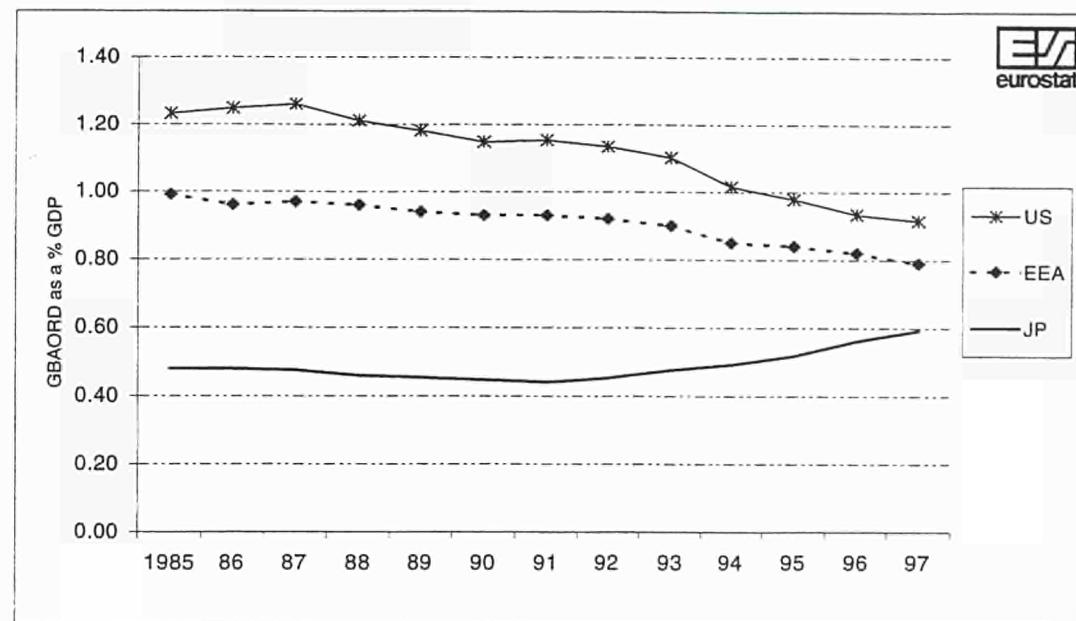

1.3. GBAORD ALLOCATION OF THE TRIAD

The United States government allocated the largest amounts of funds for R&D activities throughout the 80s and 90s, followed by the EEA and Japan. In 1997 the United States government allocated 63.2 BECU towards R&D activities as compared to the 57.6 BECU of the EEA. Japanese GBAORD is very low in comparison to the EEA and US, even after taking into consideration the size of the Japanese economy. The Japanese government allocated 22.0 BECU towards R&D activities in 1997. However at constant prices, the Japanese GBAORD increased at an annual average growth rate of 4.8% between 1985-97, whereas the EEA GBAORD increased by 0.7% (annually) and there is virtually no change for the US.

A similar pattern is observed for the triad when the GBAORD data is expressed as a proportion of GDP (figure 5). Both the United States and the EEA have experienced substantial decline in the share of GDP allocated towards R&D activities, in contrast to Japan which has gradually increased its share of GDP allocated for R&D purposes. In 1997, the United States and the EEA allocated 0.9% and 0.8% of their respective GDP to GBAORD, a substantial decrease from the 1985 level (US 1.2%; EEA 1.0%). Japan on the other hand increased its share of GDP for GBAORD from 0.5% in 1985 to 0.6% in 1997.

Figure 5 : GBAORD as a % of GDP of the Triad, 1997

1.4. SPECIFIC DEVELOPMENTS IN THE MEMBER STATES

BELGIUM

The final budget for the 1997 financial year was BEF 55.9 billion, an increase of 3.4 billion over 1996. The final budget of 1996 and 1997 shows that approximately one-third of the public-sector expenditure on R&D in Belgium came from general university funds (which are financed mainly by Belgium's constituent communities). About 20% of public R&D expenditure was on non-oriented research, with spending by the Federal Government, the Flemish community and the French-speaking community at approximately the same level.

Industrial production and technology objectives are the third largest category accounting for 15% of the total GBAORD (this expenditure is shared by the Federal Government and the three regions). Space exploration and exploitation accounted for 12% of public spending in 1997, the cost being borne solely by the Federal Government. In general, it can be seen that there were only minor variations by NABS objectives or groups of objectives between 1996 and 1997 (or indeed 1998).

Table 1 : GBAORD in Belgium, by groups of objectives (in %)

Groups of NABS objectives	Final budgets		Provisional budgets	
	1996	1997	1997	1998
2-3-4-8 Human and social objectives	7.2	7.1	6.9	7.8
1-5-7-9 Technological objectives	31.3	33.3	33.0	34.2
6 Agriculture	3.3	3.1	3.0	2.9
10 Research funded by GUF	35.2	30.8	31.1	29.6
11 Non-oriented research	17.6	20.9	21.2	21.0
12 Other civil research	4.9	4.4	4.3	4.0
13 Defence	0.5	0.5	0.5	0.4
Total	100.0	100.0	100.0	100.0

Institutional context

Belgium's federal structures (which arose from the reforms of 1980, 1988 and 1993) give primary responsibility for basic and university research to the communities, while the regions are primarily responsible for supporting industrial and technological research. The Federal Government has particular responsibility for federal scientific and cultural establishments, space research, nuclear research, a broad area of agricultural research, and Belgian participation in the activities of international research bodies.

The Interministerial Conference for Science Policy (Conférence interministérielle de la politique scientifique - CIMPS) and its administrative bodies are the instruments of dialogue between the Government, the regions and the communities.

Priorities

At federal level: Scientific support for the preparation of federal policies (especially in the area of sustainable development and promotion of the information society); ongoing support for networks of excellence ("inter-university poles of attraction") and support for the implementation of space programmes.

At regional and community level:

Flemish Community/Region: increased support for public funding of R&D in order to reach total R&D spending of 2% of GDP in 1999; modernisation and improvement of the system of R&D financing; promotion of high-technology sectors and encouragement of the dissemination of technology; promotion of the social aspects of technology.

French-speaking Community: increase in the appropriations for basic research; promotion of investment in research in the context of the drive to create employment.

Walloon Region: maintenance of or increase in the global R&D effort and in assistance to leading-edge technological sectors, in particular technological sectors with high employment potential.

Region of Brussels-Capital: promotion of SME access to R&D and of networking of regional R&D potential and greatest possible integration of R&D results into the economic processes of the region.

SPAIN

According to data obtained from the Final 1997 Budget, public funding for R&D totalled PTA 406 249 million. This represents an increase of 11.2% on the 1996 figure, in pesetas at current value. The proportion of budget allocated for the human and social objective category decreased in 1996 and 1997, but stabilised thereafter. In contrast, the proportion of GBAORD allocated to the GUF, non-oriented research and other civil research categories declined continuously during the 1996-98 period, but the reasons differ according to the group. Technological objectives declined due to much greater differential growth in the other groups, and specifically defence, for the reasons explained below.

Table 2 : GBAORD in Spain, by groups of objectives (in %)

		Final budgets		Provisional budgets	
Groups of NABS objectives		1996	1997	1997	1998
2-3-4-8	Human and social objectives	9.7	8.2	8.2	8.2
1-5-7-9	Technological objectives	33.0	30.4	30.2	25.9
6	Agriculture	4.1	4.0	3.8	3.9
10	Research funded by GUF	31.3	28.7	30.1	25.5
11	Non-oriented research	9.4	7.8	6.0	5.4
12	Other civil research	1.7	1.3	1.4	1.2
13	Defence	10.8	19.6	20.3	29.9
Total		100.0	100.0	100.0	100.0

The decrease of the GUF category share can be explained by the fact that the phase of expansion with the creation of new state-owned universities and generous funding was naturally followed by a downward trend. The decline in the share of the non-oriented research group masks the effect of gradually improving differentiation between the funding for R&D "items" in the questionnaire. Whereas some bodies previously tended to use this category as a catch-all for R&D funding, repeated insistence on the maximum possible detail in the breakdown between the various objectives has borne fruit, leading to a decline in the relative share of the non-oriented research group. The other civil research group share declined for the similar reason: insistence that only in the extreme are figures to be assigned to this chapter has brought better distribution between specific objectives, whereupon the percentage assigned to other civil research has declined within total R&D allocations.

As for the defence category, the figures for 1997 and 1998 are marked by the incorporation into the defence budget of large sums from the Ministry of Industry and Energy with a substantial industrial R&D content corresponding to the "Promotion and Industrial Strategies for Defence" programmes. This explains the reason behind the increase of almost 300% in the figure assigned to the defence objective over the three-year period. The share of the agriculture category has remained virtually stable, albeit showing a slight decrease over the 1996-98 period.

FRANCE

Institutional context

Responsibility for co-ordinating national research and development policy lies with the Ministry of Education, Research and Technology under the CRDB (civilian research and development budget). R&D budget appropriations are not confined to the CRDB alone but also include university funds and the research budget of the Ministry of Defence. In 1997, the CRDB accounted for 58% of total appropriations, defence 28% and university funds 14%.

Developments

All final budget appropriations totalled FRF 85 256 million in 1997 compared with FRF 85 963 million in 1996, representing a fall of 0.8% in terms of value which is slightly more than the rate observed in 1996. The main factor for the reduction is due to the reduction of funds allocated to the Defence Ministry research, which decreased by 6.6% in 1997 (FRF 1.7 billion). This decrease is in line with the reduction observed since 1990, representing a total of FRF 10.7 billion since this date.

Table 3 : GBAORD in France, by groups of objectives (in %)

Groups of NABS objectives	Final budgets		Provisional budgets	
	1996	1997	1997	1998
2-3-4-8 Human and social objectives	8.5	8.9	8.9	9.5
1-5-7-9 Technological objectives	21.1	21.2	21.7	22.6
6 Agriculture	3.6	3.7	3.6	3.8
10 Research funded by GUF	16.0	16.5	16.5	17.1
11 Non-oriented research	18.7	19.3	19.2	20.4
12 Other civil research	2.4	2.4	2.4	1.8
13 Defence	29.7	28.0	27.7	24.8
Total	100.0	100.0	100.0	100.0

The trends in the pattern of the CRDB by socio-economic objectives largely explain those in budget appropriations. 1997 saw no changes in the composition of the CRDB.

The prime objective of R&D public budget appropriations is the general advancement of knowledge. They comprise university general funds and non-targeted research, which accounted for 36% in 1997, a similar level to 1996. Technological objectives occupy second place in terms of civilian budget appropriations; their proportion has hardly changed in recent years. Within them there was little change in 1997, despite a slight increase in space research. The share of human and social objectives has increased considerably. Health, the main item (NABS 4), showed an increase in 1997.

IRELAND

Since the introduction of the EU Community Support Framework (CSF) in 1989 the Irish government has used the opportunity to invest heavily in science and technology initiatives. It is estimated that in 1997 one third of government funds for R&D come from the CSF. The second round of CSF Operational Programmes came into effect in 1994. The levels of funding under its various measures have been phased in, therefore there are no wide variations in the CSF allocations between 1996 and 1997 to the NABS chapters. The most significant changes are in agriculture and research financed from GUF as outlined in the table below.

The total budgetary allocation to R&D in 1997 amounted to IEP 163.6m, an increase of IEP 3.8 million (2.4%) over the 1996 level. The reason for this increase is due to the significant increased investment in the agricultural sector (IEP 9.7 million), technological objectives (IEP 2.9 million) and in non-oriented research (IEP 2.8 million). This is partly offset by the decrease in research financed from GUF (IEP 10.4 million). Although research investment in the third level sector is constantly increasing in real terms, the budgeted exchequer support decreased significantly in 1997. The actual expenditure has increased by 14.8% between 1996 and 1997.

Table 4 : GBAORD in Ireland, by groups of objectives (in %)

	Groups of NABS objectives	Final budgets		Provisional budgets	
		1996	1997	1997	1998
2-3-4-8	Human and social objectives	14.5	13.4	13.9	14.0
1-5-7-9	Technological objectives	37.0	37.9	39.4	37.2
6	Agriculture	14.8	20.5	21.2	10.5
10	Research funded by GUF	28.4	21.4	18.3	22.3
11	Non-oriented research	5.3	6.9	7.2	16.0
12	Other civil research	-	-	-	-
13	Defence	-	-	-	-
Total		100.0	100.0	100.0	100.0

Funding for R&D in the natural resource areas has traditionally been declining since the mid-1980s. The CSF has provided the opportunity to reverse this trend. A number of research programmes have been initiated into specified areas in agriculture, food, forestry and marine. Researchers in the higher education sector are the main recipients of these research contracts. A Marine Institute has also been established with the assistance of CSF funds. For the first time all research and technological development in the marine area is co-ordinated by the one institution. Research expenditure in agriculture (chapter 6) has increased from IEP 23.7 million in 1996 to IEP 33.5 million in 1997.

NABS chapter 7 is significantly affected by the allocation of funds from the CSF. Funding for R&D in support of industrial development increased from IEP 53.6 million in 1996 to IEP 56.3 million in 1997. Grant support by the industrial development agencies for R&D projects increased across all sectors except software development. The decrease in social sciences and humanities is largely accounted by the phasing out of government expenditure in relation to the design and development of new computer systems to support the administration of social welfare services.

Funding for non-oriented research (chapter 11) has increased from IEP 8.5 million in 1996 to IEP 11.3 million in 1997. There was increased funding in the marine and wildlife sectors, and a new drugs programme was introduced where researchers in 3rd level institutions are funded to research projects in areas such as drug detection and analysis, pharmacology and social impacts.

Allocation of funds by the government increased for all other chapters, except chapter 3, which showed a marginal decrease in allocation in 1997 compared to 1996.

Methodology

The data has been calculated according to the methodology introduced in 1992. This method results in government funds only being included in the analysis. The definition of government funds includes money received from the EU Community Support Framework in support of R&D activities. The data for 1997 has been classified according to the NABS 1993 classification system.

ITALY

In 1997, final budget amounts to ITL 12,047,336 million. The increase on 1996 final budget is 9.0% in nominal terms and 6.2% in real terms (at 1995 prices). The most significant increases are registered for energy (24%, due to higher allocations to National Agency for New Technologies and Environment) and GUF (16.3%) objectives.

Decreases on 1996 final budget occurred in the following objectives: society (-1.7%), space (-5.7%), and non-oriented research (-16.2%). The negative variation in the space category is due to an important decrease of space research allocation of the Italian Space Agency (ASI). Other variations, positive or negative, are especially due to the reorganisation of National Research Council (CNR) classification: in 1997, CNR allocations are broken down following the results of a survey on NABS objectives performed at the different research institutes and services.

In 1998, the provisional budget for research amounts to ITL 11,889,662 million, representing a decrease of 1.3% in nominal terms or a decrease of 4.7% in real terms (at 1995 prices). The major differences between final budget for 1997 and provisional budget for 1998 are due to an increase of allocations to environment (partly due to a reorganisation of CNR classification) and energy, and decreases in human health and in defence.

Table 5 : GBAORD in Italy, by groups of objectives (in %)

		Final budgets		Provisional budgets	
Groups of NABS objectives		1996	1997	1997	1998
2-3-4-8	Human and social objectives	14.8	14.0	16.0	13.3
1-5-7-9	Technological objectives	23.4	23.1	18.6	23.0
6	Agriculture	2.1	2.2	2.3	1.9
10	Research funded by GUF	42.5	45.4	47.4	48.0
11	Non-oriented research	14.1	10.9	12.1	11.1
12	Other civil research	-	-	-	-
13	Defence	3.1	4.4	3.5	2.7
Total		100.0	100.0	100.0	100.0

Share of funds allocated to researchers financed from GUF have increased in contrast to social sciences & humanities, non-oriented research and defence whose relative importance have decreased. Share of funds allocated for the technological objectives and agriculture have remained more or less stable

Changes occurred between provisional and final data in 1997 due to under-estimation of provisional data. Positive differences can be found especially for objectives 9 (space) and 10 (university).

THE NETHERLANDS

Central government budget appropriations for R&D show a nominal increase of approximately 50 million NLG in the figures between the budgetary years 1996 and 1997 (final budget) and 180 million NLG between 1997 and 1998 (provisional budget). The final budget for 1997 amounts to 5.8 billion NLG in current terms, while the provisional budget for 1998 is higher, with a difference of +125 million NLG, equal to an increase of 2.2% between 1997 and 1998.

Table 6 : GBAORD in the Netherlands, by groups of objectives (in %)

Groups of NABS objectives	Final budgets		Provisional budgets	
	1996	1997	1997	1998
2-3-4-8 Human and social objectives	11.1	11.0	10.4	10.6
1-5-7-9 Technological objectives	19.2	19.4	19.2	19.8
6 Agriculture	4.3	4.0	4.2	3.8
10 Research funded by GUF	46.6	46.1	47.0	46.4
11 Non-oriented research	10.9	11.2	11.0	11.3
12 Other civil research	5.0	5.4	4.9	5.1
13 Defence	3.0	3.2	3.2	3.0
Total	100.0	100.0	100.0	100.0

The relative positions of the different objectives are quite stable. A substantial proportion of the budget is allocated to fundamental research, which is reflected by the fact that approximately 47% of the total budget are allocated to the GUF category and 11% to the non-oriented research category. Almost 20% of the budget are devoted to R&D with technological objectives. Research with human and social objectives is the third major area, with a share of approximately 10%. Changes in budgets of ministries are not the result of policy changes, but mainly due to methodological changes and better monitoring of R&D-efforts of ministries.

Priorities

S&T policy is oriented to stimulating scientific quality on the one hand and societal relevance on the other hand. This should lead to a closer co-operation between institutes in the public knowledge infrastructure and market parties (private as well as public). Public research institutes receive a basic funding (the relative weight depends on the function) and are stimulated to acquire contracts, both public and private.

Major methodological changes

An effort has been made to harmonise the funding (GBAORD) and performance (Statistical Office) figures on university research. This results in higher figures for GUF as part of GBAORD.

AUSTRIA

Public funding of R&D amounted to ATS 15.6 billion in 1997 (final budget). This means that public R&D expenditure grew by a nominal 0.8% compared with the previous year. According to the federal estimate (provisional budget), public R&D funding for 1999 amounts to ATS 16.9 billion, a nominal increase of 1.4% on the corresponding figure in the provisional budget for 1998 (ATS 16.7 billion). Compared with the figure from the final budget for 1997, the 1999 figure represents a nominal increase of 8.6%.

1999 saw no fundamental change to the particularly dominant position occupied by the universities in Austrian research, with the result that about 65% of overall federal R&D expenditure is accounted for by Chapter 10, "Research financed from general university funds (GUF)". Following on from a slight nominal increase (0.9%) between 1996 and 1997, however, bigger increases have been recorded, particularly between 1997 and 1998 (1998: +8.6%, 1999: +1.7%). This is mainly because of the bigger difference, compared with previous years, between the provisional and final budgets for a given reference year. Most of the other groups of objectives, on the other hand, show much smaller rates of growth, with the "Technological objectives" group actually registering a nominal decline of 4.6% in 1998.

As can be seen from the following table, the relative share of "Research financed from GUF" is 66% in 1999. It should be borne in mind that ÖSTAT's detailed R&D surveys of Austria's universities have revealed that the share accounted for by applied research and experimental development is very large (1993: Applied research: 40%; experimental development: 11%).

Table 7 : GBAORD in Austria, by groups of objectives (in %)

Groups of NABS objectives	Final budgets		Provisional budgets	
	1996	1997	1997	1998
2-3-4-8 Human and social objectives	8.5	9.4	8.9	8.9
1-5-7-9 Technological objectives	9.5	9.2	8.2	8.1
6 Agriculture	3.2	3.3	3.2	3.2
10 Research funded by GUF	64.7	64.7	65.8	65.9
11 Non-oriented research	14.0	13.2	13.8	13.8
12 Other civil research	0.1	0.2	0.1	0.1
13 Defence	0.0	0.0	0.0	0.0
Total	100.0	100.0	100.0	100.0

As there are not usually very significant differences between the provisional and final budgets in Austria, a meaningful comparison can be made between the final budgets for 1996 and 1997 on the one hand and the provisional budgets for 1998 and 1999 on the other.

This means that, as in the years up to 1994, total public R&D spending has been rising continually in nominal terms (1998: 7.1%, 1999: 1.4%), with the relative shares of all the "smaller" groups of objectives remaining unchanged (apart from the relative share of "Technological objectives", which has declined), whereas the relative share of "Research financed from GUF" has increased.

Methodology

There were no methodological changes during the reference period (1996-1999), which means that the data are fully comparable. The classification by NABS chapters is done via a conversion from the national system to the OECD system of socio-economic objectives, which is almost identical to the NABS single-digit chapters.

UNITED KINGDOM

Data on government expenditure on Research and Development are collected by means of an annual survey of Central Government Departments. The total net Government expenditure on R&D in 1997-98 was GBP 5892 million, representing 2.9% of the total Central Government expenditure and 0.7% of the UK GDP. The expenditure on R&D in 1997-98 increased in cash terms by GBP 132.2 million (2%) on 1996-97.

Table 8 : GBAORD in the UK, by groups of objectives (in %)

	Groups of NABS objectives	Final budgets		Provisional budgets	
		1996	1997	1997	1998
2-3-4-8	Human and social objectives	20.5	20.3	20.4	20.6
1-5-7-9	Technological objectives	7.8	6.6	6.9	5.4
6	Agriculture	4.5	4.6	4.4	4.3
10	Research funded by GUF	17.8	17.5	18.5	18.1
11	Non-oriented research	11.8	11.4	11.8	11.7
12	Other civil research	0.4	0.4	0.4	0.4
13	Defence	37.2	39.2	37.7	39.5
Total		100.0	100.0	100.0	100.0

The defence category is by far the largest sector accounting of around 39% of the total UK GBAORD. In 1997-98, Government expenditure on R&D in Defence was GBP 2312 million, representing an increase of 8% from the previous year. Social Sciences & Humanities objective is the second biggest category and it shows a small increase in expenditure from GBP 1183 million in 1996-97 to GBP 1196 million in 1997-98.

Other categories showing an increase in expenditure between 1996-97 to 1997-98 were; Agriculture, Research financed from GUF, and Other Research. Expenditure on agriculture increased from GBP 257 to GBP 269 million (5%), Research financed from GUF increased from GBP 1027 to GBP 1033 million (1%) and Other Research increased from GBP 20 to GBP 21 million (5%). Technological objectives and Non-orientated research on the other hand decreased by 13% and 1% respectively over the same time period.

NORWAY

Net Government Budget Appropriations and Outlays for R&D (GBAORD) in the provisional budget for 1998 amounted to nearly 8.7 billion NOK. In current prices this is an increase of approximately 410 million NOK from the final budget for 1997, or 5%. In real terms this means a 2.7% growth. From the final budget for 1996 to the final budget for 1997 there was a nominal increase of 4.3%, but in real terms the increase is only 0.3%.

Table 9 : GBAORD in Norway, by groups of objectives (in %)

		Final budgets		Provisional budgets	
		1996	1997	1997	1998
Groups of NABS objectives					
2-3-4-8	Human and social objectives	19.2	19.7	19.7	19.2
1-5-7-9	Technological objectives	22.9	21.7	21.7	21.3
6	Agriculture	9.4	9.3	9.3	9.1
10	Research funded by GUF	35.5	37.0	36.8	38.5
11	Non-oriented research	7.2	6.8	6.9	6.4
12	Other civil research	-	-	-	-
13	Defence	5.8	5.5	5.6	5.5
Total		100.0	100.0	100.0	100.0

38.5% of net Norwegian GBAORD in 1998 was allocated through General University Funds (GUF). Universities are thus by far the most prominent recipient of Government R&D funding, and the share still seems to be on the increase. Funds for technological objectives account for one fifth, of which industrial production and technology makes up almost two thirds. The overall technology share, however, has decreased over the period from 23% to around 21% in 1997. Support for R&D with human and social objectives holds a slightly lower share than technology, but the growth of late seems to have culminated in 1997. Finally, funds for R&D directed towards agriculture and defence as well as non-oriented research are (slightly) decreasing.

CHAPTER 2: R&D Expenditure and R&D Personnel

2.1. R&D EXPENDITURE AND R&D PERSONNEL AT NATIONAL LEVEL

Introductory remark

R&D activities require both funding and qualified staff. For statistical purposes, two inputs are measured - R&D expenditure and R&D personnel - normally on an annual basis. Both have their strengths and weaknesses, hence both are necessary to secure an adequate representation of the effort dedicated to R&D activities.

The basic measure for R&D expenditure is the “intramural expenditures”, which are all expenditures for R&D performed within a statistical unit or sector of the economy, whatever the source of funds (Frascati Manual, § 335). For statistical purpose, both current and capital expenditures are included.²

R&D personnel data measure the amount of resources going *directly* into R&D activities. This includes all persons employed directly in R&D plus persons supplying direct services to R&D, such as managers, administrative staff and office staff (Frascati Manual § 279). R&D personnel data are collected for both full-time equivalent (FTE) and in-terms of physical persons (“headcount”, HC).³

Both intramural R&D expenditure and R&D personnel are broken down by institutional sector, i.e. the sectors in which the R&D is performed are specified. Four sectors are relevant in the context of this publication where indicators for R&D performance are compiled: the business enterprise sector, the government sector, the higher education sector, and the private non-profit sector⁴ (see part 2.5 for further details).

2.1.A. R&D EXPENDITURE OF THE EEA

R&D expenditure in the EEA in 1997 is over ECU 137 billion

In 1997, total R&D expenditure in the EEA (excluding Luxembourg and Liechtenstein) amounted to an estimated ECU 137,700 million, representing a nominal increase of 4.6% on the previous year. In constant prices (PPS 1990), the R&D expenditure of the EEA increased by 2.3% from the previous year.

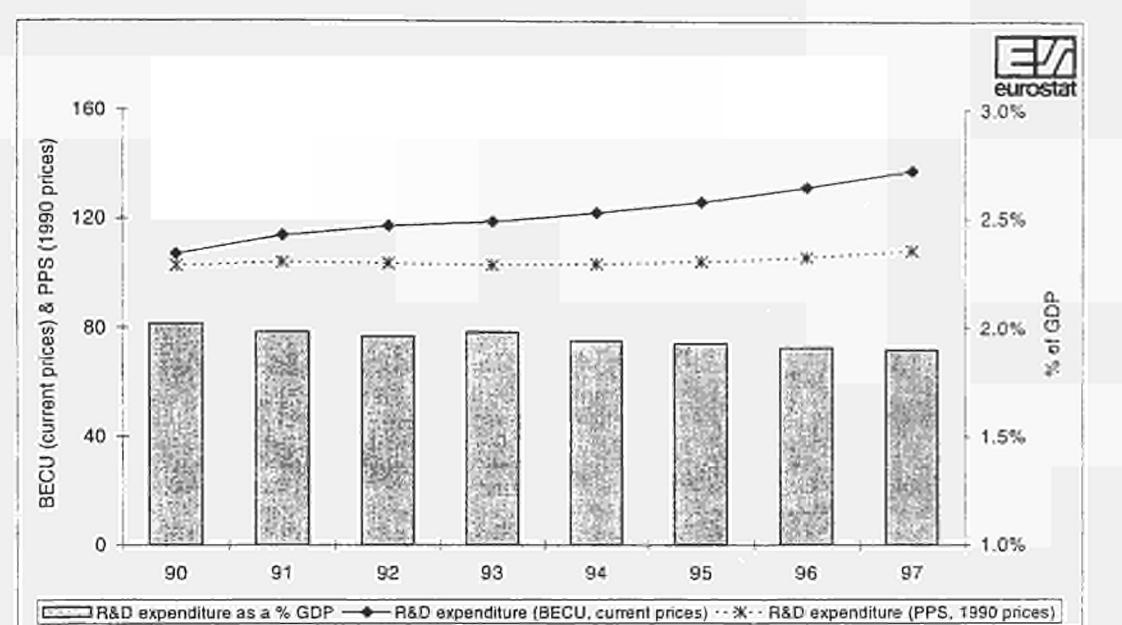

R&D expenditure as a percentage of GDP was above 2% between 1988-90, but since then this ratio has continuously declined (except 1993) and in 1997 total R&D expenditure in the EEA amounted to 1.9% of its respective GDP (figure 6).

² Data on R&D expenditures are performance based, i.e. they refer to R&D effort that has been made in a given year. Owing to the time it takes to carry out such surveys and to process their results, data on R&D expenditure do not become available until a substantial time after the R&D has been carried out. Data on R&D expenditure are available for all Member States of the European Union (excluding Luxembourg), Norway and Iceland from 1987 onwards.

³ The data on R&D personnel are also performance based; i.e. they refer to the personnel that were employed in R&D in a given year. Data on R&D personnel are available in terms of HC and FTE for all Member States of the European Union (excluding Luxembourg), Norway and Iceland from 1987 onwards.

⁴ In other publications (e.g. by OECD) where data are also compiled by source of funds the sector “abroad” is also relevant.

Figure 6 : Trends in R&D expenditure of the EEA, 1990-97

Germany, France and the UK accounts for 67% of the EEA R&D expenditure

As expected, most of the EEA R&D expenditure is accounted for by Germany, France and the United Kingdom. Latest available figures (1996) shows that they account for approximately 67% of the total EEA R&D expenditure; however the share of EEA R&D accounted by the above mentioned three countries have been on a downward path since 1993.

In constant prices (1990 PPS), R&D expenditure of the four large EU Member States (Germany, France, Italy and the United Kingdom) have remained fairly stable since the late 1980s and early 1990s. However, the R&D expenditure of the smaller EEA countries like Ireland, Sweden, Denmark and Finland has increased over same time period.

3.8% of the Swedish GDP is devoted to R&D activities

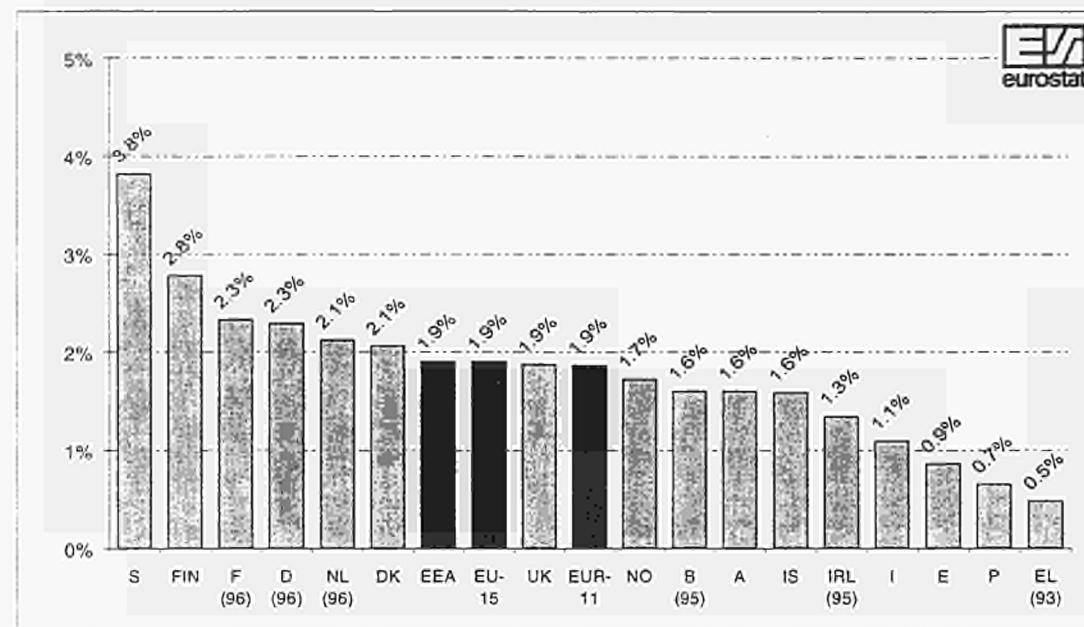

When R&D expenditure is expressed as a proportion of GDP, Sweden clearly stands out from the rest of the EEA countries (figure 7). In 1997, 3.8% of the Swedish GDP was devoted to R&D activities, which represents a substantial increase from the 1991 figure. The largest increase in the R&D expenditure over GDP ratio since 1991 is recorded for Sweden followed by Finland and Iceland and the largest decreases are recorded for the United Kingdom, Germany and Italy. To a certain extent there exists a north-south divide, where the expenditure over GDP ratio for the most of the northern countries is above the EEA average and for the southern countries it is below the EEA average.

R&D EXPENDITURE BY INSTITUTIONAL SECTORS

More than 60% of R&D expenditure is carried out in the business enterprise sector

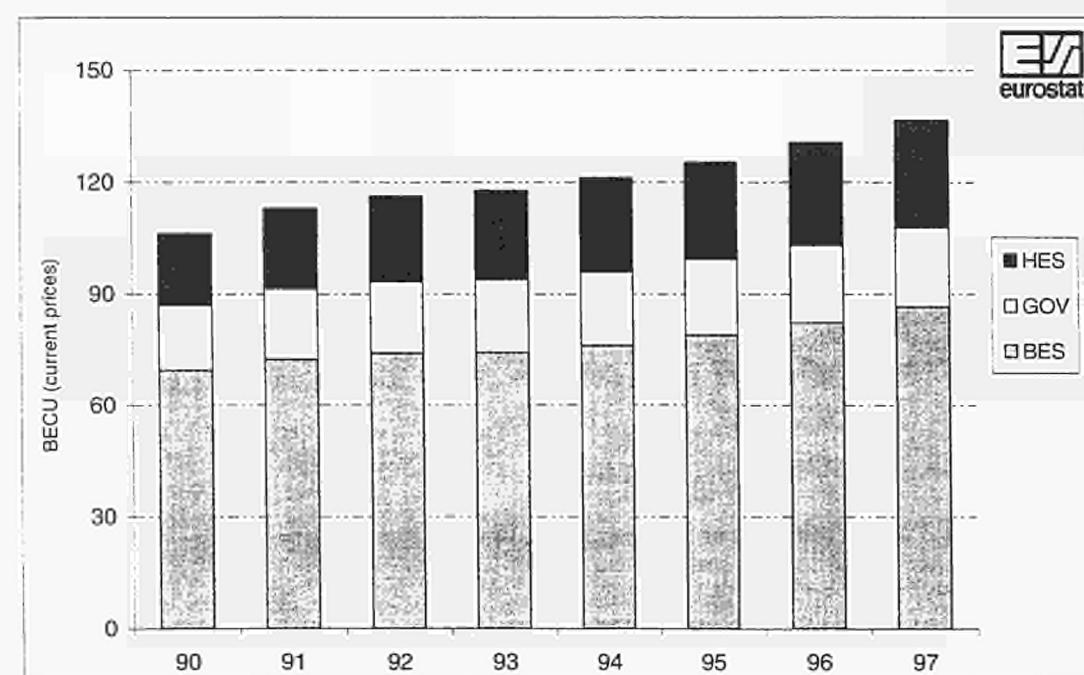

Most of the R&D expenditure of the EEA is carried out in the business enterprise sector (BES), followed by the higher education sector (HES) and the government sector (GOV). In 1997 BES accounted for around 63% of the total EEA R&D expenditure, representing a 2% point decline from the 1990 level.

Figure 7 : R&D expenditure as a % of GDP of the EEA countries, 1997

HES is the second largest sector; R&D expenditure carried out by this sector has continuously increased since the late 80s. In 1997, HES accounted for around 21% of the total EEA R&D expenditure, representing a 3% point increase from the 1990 figure. The share of the government sector has remained more or less stable since the late 80s and in 1997 this sector accounted for around 16% of the total EEA R&D expenditure (figure 8).

Figure 8 : R&D expenditure of the EEA by institutional sectors, 1990-97

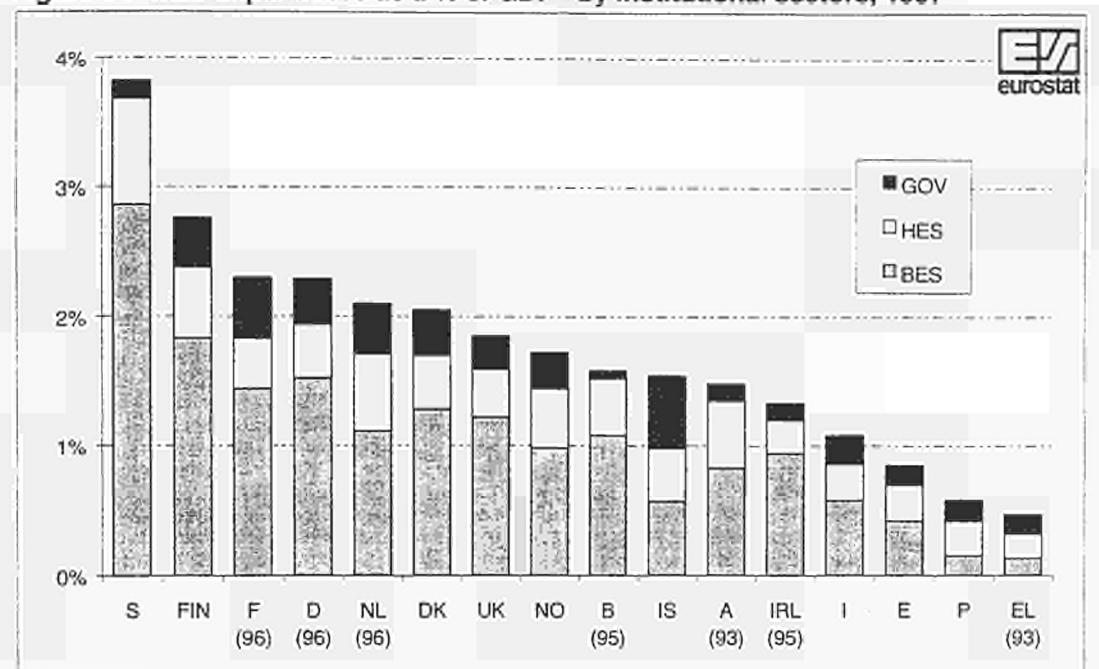

At country level:

In most countries, the BES accounts for the largest share of R&D expenditure (as a % GDP), the exception being Greece and Portugal. The highest share of the R&D expenditure carried out by the BES in 1997 is recorded for Sweden (75%), followed by Ireland (71%) and Belgium (69%) (figure 9).

By contrast, in Greece and Portugal, the largest share of their respective total R&D expenditure is accounted by the HES. Total R&D expenditure of Iceland on the other hand is more evenly distributed amongst the three sectors.

Figure 9 : R&D expenditure as a % of GDP - by institutional sectors, 1997

2.1.B. R&D PERSONNEL OF THE EEA

Over 2.2 million R&D personnel in the EEA

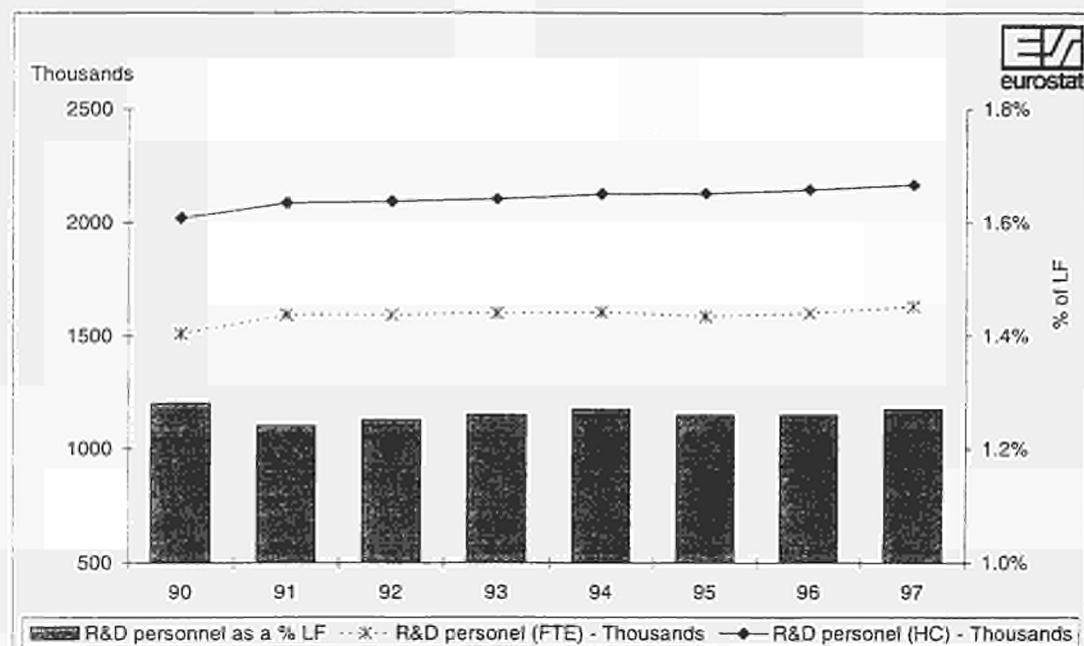

In 1997, the number of R&D personnel in the EEA (excluding Luxembourg and Liechtenstein) was an estimated 2,167,100 in terms of head count, which translated as 1,628,600 full time equivalents (figure 10). In the late 80s, R&D personnel (both HC and FTE) within the EEA gradually increased, although since then it has stabilised around the 2.1 to 2.2 million (HC) mark. Expressed as a percentage of the labour force, approximately 1.27% of the EEA labour force were employed in R&D in 1997, representing a slight increase on the previous year.

Around 60% of the EEA R&D personnel are located either in Germany, France or the UK

In terms of HC, approximately 60% of the total EEA R&D personnel are located either in Germany, France or the United Kingdom. However, the number of R&D personnel located in Germany has been continuously declining since 1991 and the latest figures show that the German 1997 R&D personnel is some 13.5% lower than the 1991 level. The number of R&D personnel located in France has continuously increased over the last seven years and the latest figures show that the 1997 level of R&D personnel is some 11% higher than the 1990 level.

The numbers of R&D personnel (both in terms of head count and FTE) in many countries, namely the smaller countries or those with a relatively low base, continue to increase according to the latest available data. R&D personnel located within the Nordic countries (Denmark, Sweden, Finland and Norway) are at their highest levels. R&D personnel located in Norway and Sweden increased at an average annual growth rate of 8% and 6% respectively, between 1991-97.

Figure 10 : Trends in R&D personnel located within the EEA, 1990-97

Nordic countries have the highest proportion of R&D personnel as a % of the LF

For more comparable comparisons, R&D personnel (HC) are expressed as a percentage of labour force (figure 11). As with R&D expenditure, the highest proportion of R&D personnel as a percentage of the labour force in 1997 can be found in Sweden (2.3%) followed by Finland and Iceland (2.2% each).

The other Nordic countries are also well above the EEA average, and generally show an upward trend. In contrast, the proportion of R&D personnel as a percentage of the labour force of the Southern EEA countries (Greece, Spain, Italy and Portugal) are well below the EEA average, despite the upward trend in recent years.

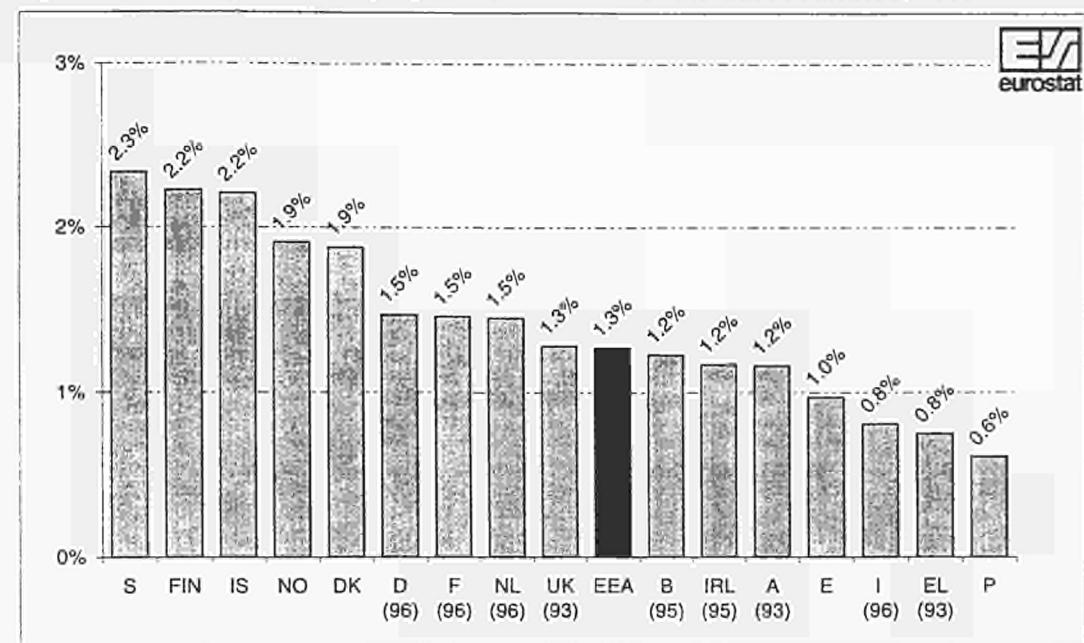

R&D PERSONNEL BY INSTITUTIONAL SECTORS

Although at the EEA level the BES remains the largest employer of R&D personnel, its share has been on a downward path. In 1990, around 51% of the total EEA R&D personnel were employed within the BES, but by 1997 this share had declined to around 47%. Employment of the R&D personnel within the HES on the other hand has been on an upward trend; its share of the R&D personnel has increased from around 31% in 1988 to 38% by 1997.

Figure 12 shows the R&D personnel as a proportion of the labour force. In 1997, around 0.59% of the EEA labour force are engaged R&D activities within the BES, 0.47% (of the LF) in the HES and around 0.2% in the Government sector.

At individual country level, the BES is the largest employer of R&D personnel in Belgium, Germany, France, the Netherlands, the United Kingdom, plus the two Nordic countries (Finland and Sweden). In contrast, the HES is the largest employer of R&D personnel in the southern EEA countries (Greece, Spain, Italy and Portugal), along with Ireland, Austria, Iceland and Norway (figure 13).

Figure 11 : R&D personnel (HC) as a % of the LF of the EEA countries, 1997

The latest available data shows that the R&D personnel (HC) in the higher education sector are at a higher level in most countries (with the exception of Belgium, Germany and the Netherlands) than their respective 1991 level. The largest increase of R&D personnel in the HES has been in Greece, Ireland and Spain, i.e. those countries starting from the lowest base. Steady increases in FTE in the HES can also be seen in France, Finland, Sweden, the UK and Norway.

Figure 12 : R&D personnel (HC) as a % of LF of the EEA (institutional sectors)

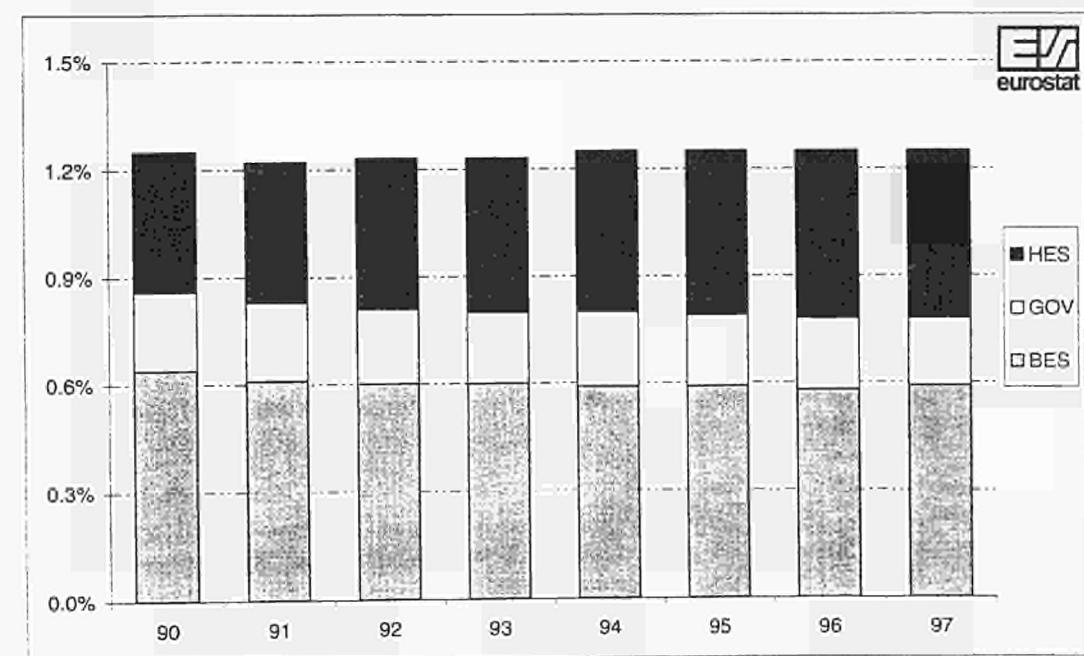

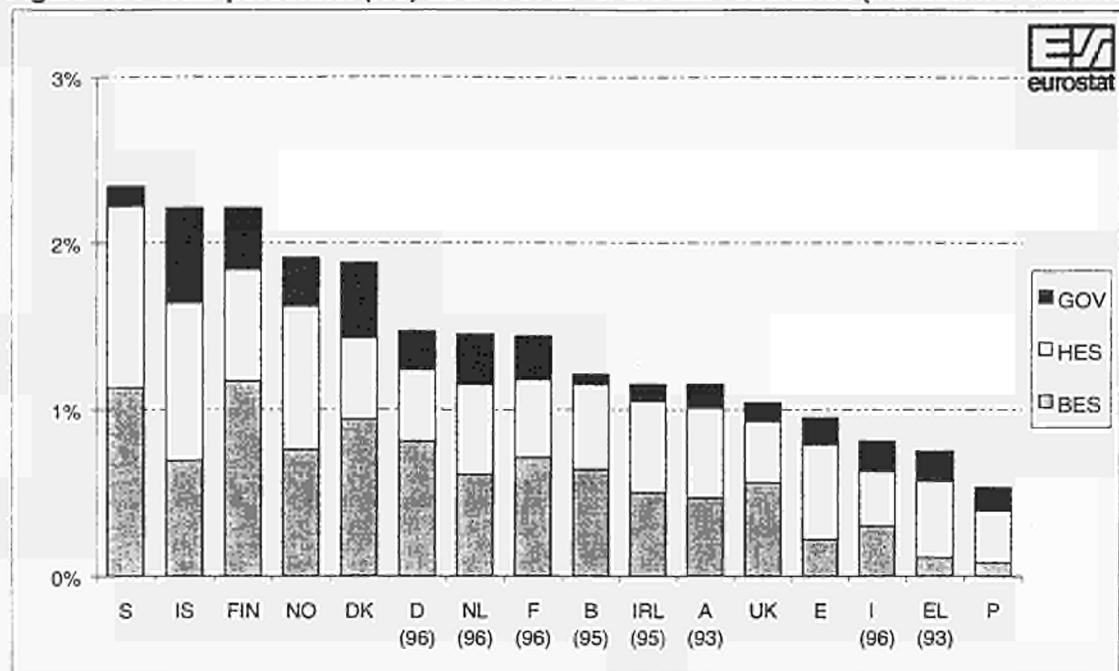

Figure 13 : R&D personnel (HC) as a % of LF of the EEA countries (institutional sectors)

2.2. R&D EXPENDITURE AND PERSONNEL AT REGIONAL LEVEL

Introductory remark

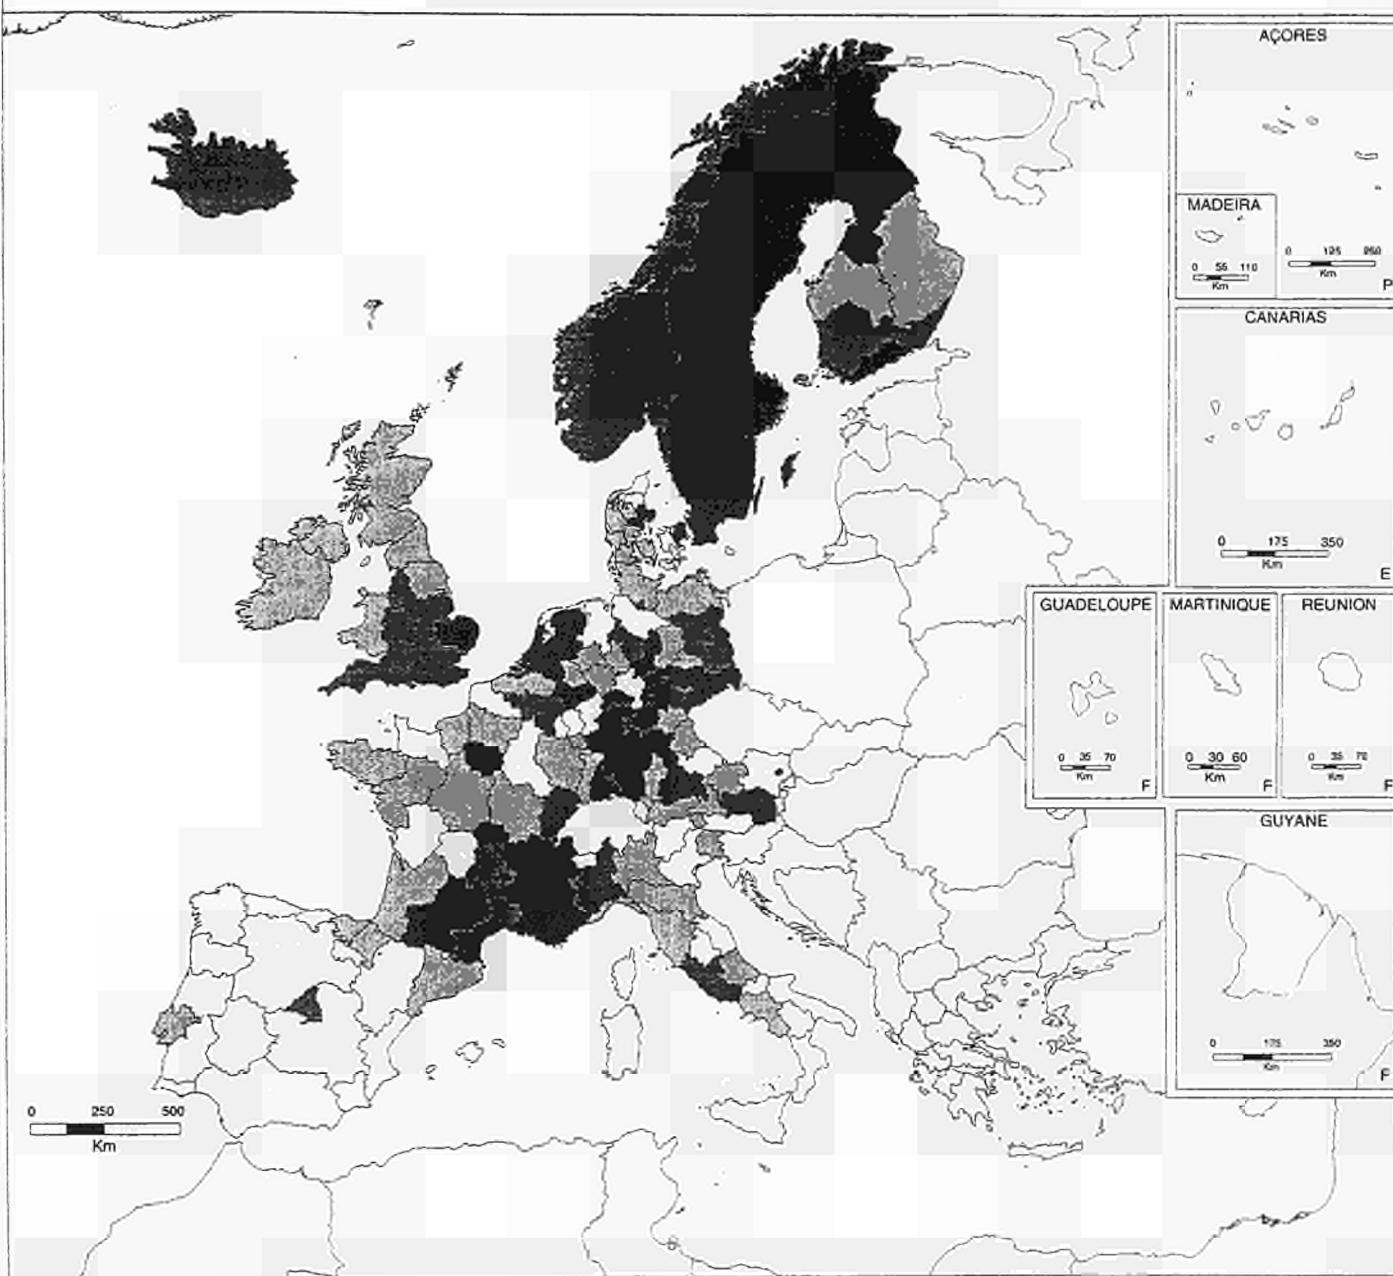

R&D expenditure and R&D personnel are broken down by region. Regional breakdowns of the R&D expenditures and R&D personnel are time-consuming and problematic. In the case of R&D expenditures, there is a particular problem in the case of units, particularly enterprises, which consist of two or more local units in different regions. If, in extreme cases, there is no additional information, all the intramural R&D expenditure (or R&D personnel) of the unit must be attributed to the region in which its headquarters are located, including any R&D expenditures incurred (or employee working) in other local units in other regions. The extent of such errors varies according to the economic structure and size of the country, and according to their survey methods.

The size of each region must be taken into account when interpreting regional intramural R&D expenditures or R&D personnel and most particularly when comparing regions. For this reason, such comparisons are based on derived indicators such as the intramural R&D expenditure of a region as a percentage of its respective GDP or R&D personnel of a region as a percentage of the labour force.

French regional R&D data should be treated with slight caution because they are under estimated due to the fact 16.1% of R&D expenditure and 29.2% of R&D personnel could not be registered to any particular region.

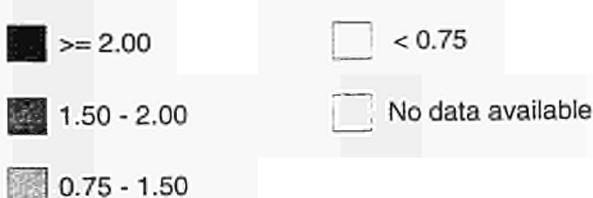

R&D data for the East Anglia region (United Kingdom) is an over estimation and should be treated with caution, this is due to the regional data which is shown against East Anglia now includes a number of other companies located within the Eastern region.

Regional R&D expenditure *

Expenditure by region, all sectors, as % of GDP (NUTS 95 level 2**)

French regional data are underestimated because 16.1% of the data are not allocated to any specific regions

* Data for 1995 except:
1993: EL, A
1996: F, UK, NO

** NUTS level 0: NL, IS, NO
NUTS level 1: B, S, UK
NUTS level 3 (aggregated): DK

2.2.A. R&D EXPENDITURE AT REGIONAL LEVEL

There are significant disparities in the R&D expenditure between regions (NUTS level 1), even within the EU Member States. In absolute terms, Île de France (France) is the leading region within the EU Member States, followed by Baden-Württemberg and Bayern (both Germany) and South East (UK). According to the latest figures, the R&D expenditure of the five leading regions amounted to approximately MECU 44 123, representing a third of the EEA total.

For a more comparable regional portrait, R&D expenditure is expressed as a % of regional GDP, which show East Anglia (UK) to be the leading region, followed by Baden-Württemberg (Germany), Berlin (Germany), Île de France (France) and Bremen (Germany) (table 10).

Madeira is the leading Portuguese region in terms of R&D expenditure (table 11), but in comparison to East Anglia, Madeira's R&D expenditure (as % of GDP) is some six times below that of East Anglia. As can be seen from table 11, there are significant disparities between regions within individual EU Member States and the disparities between the regions have remained more or less stable over time.

Table 10 : R&D expenditure of the five leading regions (latest available year)

 Region	Country	Rank	R&D expenditure as a % of GDP	Rank	R&D expenditure (MECU)
East Anglia	UK	1	3.80%	7	3 130
Baden-Württemberg	D	2	3.65%	2	9 711
Berlin	D	3	3.36%	12	2 516
Île de France	F	4	3.29%	1	11 530
Bremen	D	5	2.84%	38	607

Note: 1996 data for France and the UK and 1995 data for Germany.

Table 11 : Regional disparities of the R&D expenditure as % of GDP (latest available year)

	High R&D expenditure regions	R&D Expenditure / GDP	Low R&D expenditure regions	R&D Expenditure / GDP

Regional R&D personnel *

R&D personnel (HC) by region, all sectors, as % of labour force (NUTS 95 level 2**)

French regional data are underestimated because 29.2% of the data are not allocated to any specific regions

* Data for 1995 except:
1993: EL, A, UK
1996: DK, E, I, IS

** NUTS level 0: NL, A, IS, NO
NUTS level 1: B, S, UK

2.2.B. R&D PERSONNEL AT REGIONAL LEVEL

Similar to the R&D expenditure, there are significant disparities in the R&D personnel between regions (NUTS level 1), even within the countries. In absolute terms, the largest numbers of R&D personnel (HC) are located in the South East (UK), followed by Île de France (France) and Baden-Württemberg. The latest available R&D personnel figures shows that around 30% of the EEA R&D personnel are located within the leading five regions.

Once R&D personnel figures are expressed as a percentage of the LF, Brussels becomes the leading region, followed by Île de France and Baden-Württemberg (table 12). The reason behind the high ranking of Brussels is that its labour force is relative small. The number of R&D personnel located within South East (UK) are some seventeen times higher than that of Brussels but due to the relatively large labour force located within the South East (UK) it does not appear in the top five ranking.

The regional disparities within individual EU Member States for R&D personnel are almost identical to the R&D expenditure disparities. The disparities between high R&D personnel and low R&D personnel regions ranges from 2.1% point (Finland) to 0.1% point (Portugal) (table 13).

Table 12 : R&D personnel (as % of LF) of the five leading regions (latest available year)

EV eurostat Region	Country	Rank	R&D personnel as a % of LF	Rank	R&D Personnel
Bruxelles-Brussel	B	1	2.39%	48	9 191
Île de France	F	2	2.31%	2	121 910
Baden-Württemberg	D	3	2.26%	3	113 479

P (97)	Madeira	0.67%	Acores	0.54%
FIN (97)	Manner-Suomi	2.24%	Ahvenanmaa-Åland	0.12%
UK (93)	South East (UK)	1.77%	Northern Ireland	0.53%

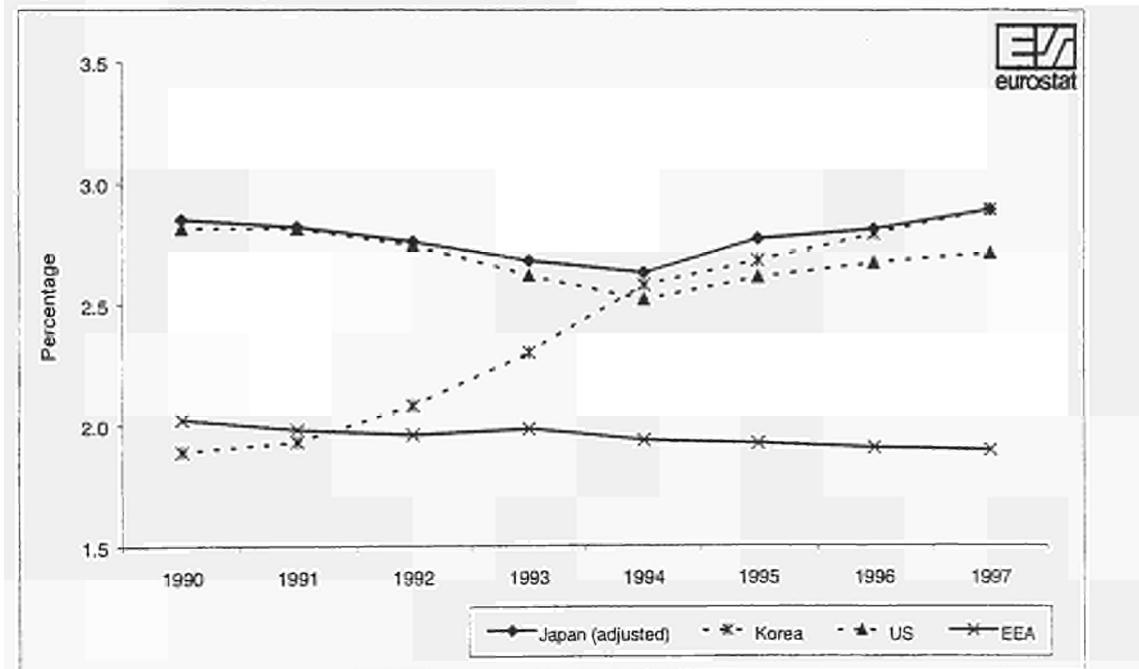

2.3. GLOBAL COMPARISONS

The latest available figure shows that the R&D expenditure of the United States in 1997 amounted to 168 BECU, which is approximately 22% higher than that of the EEA total. Both Japanese and Korean R&D expenditure are relatively small in comparison to that of the United States or EEA; however in recent years their average annual growth rate have been higher than that of the United States or EEA.

Once the size of the economy is taken into consideration, it shows that both Japan and Korea are at the forefront of R&D activities and the EEA is lagging behind. Japan and Korea devoted approximately 2.9% of their respective gross domestic product towards R&D expenditure in 1997, whereas only 1.9% of the EEA's gross domestic product was allocated towards R&D expenditure (Figure 14).

From 1990 onwards, R&D expenditure as a % of GDP of both the United States and Japan declined continuously but since 1994 the R&D expenditure has been on an upward trend, but their respective 1997 ratios are below that of 1990. Korean R&D expenditure as a % of GDP on the other hand increased dramatically over the same period and since 1994 it has been higher than that of the United States. The R&D expenditure of the EEA, as a % of GDP, is far below its major competitors and since 1993 has been on a downturn path.

Figure 14 : R&D expenditure as a % of GDP

Most of the R&D expenditure of the triad is undertaken within the business enterprise sector (BES), followed by the higher education and government sectors. The 1997 BES R&D expenditure (as a % of GDP) of the United States and Japan are some five times larger than that of the higher education sector, whereas for the EEA the ratio is some three times greater (table 14). BES R&D expenditure of the triad has been in decline since 1990 and the largest decrease is observed for the EEA, whose R&D expenditure as a proportion of GDP declined from 1.31% (1990) to 1.19% (1997).

Table 14 : R&D expenditure (as a % of GDP) by institutional sector

Source: OECD and Eurostat.

* PNP included.

1997 R&D expenditure (as a proportion of GDP) by the higher education sector of the United States and Japan are below that of the 1990 level, whereas the EEA's R&D expenditure has been increasing over time and its 1997 figure is above the 1990 level. Government sector R&D expenditure accounts for the smallest share of the three sectors. The general trends for the United States and the EEA have been a downturn path of R&D expenditure (as % of GDP) of this sector whereas Japan has experienced a slight increase.

2.4. SPECIFIC DEVELOPMENTS IN THE MEMBER STATES

BELGIUM

R&D expenditure

The results of the 1996 survey for 1994 and 1995 show that gross domestic expenditure on R&D (GERD) in Belgium represented 1.61% of GDP in 1995. Most of this expenditure was by Belgian undertakings (1.09% of GDP). The rate of R&D activity in the business enterprise sector, as a percentage of gross regional products, was highest in the Flemish region, followed by the Walloon and Brussels-Capital regions.

The non-markets sectors in Belgium (public authorities, private non-profit organisations and higher education) accounted for 0.52% of GDP. The rate of R&D activity per region in this sector, as a percentage of gross regional product, was highest in the Brussels-Capital region, followed by the Walloon and Flemish regions.

SPAIN

R&D expenditure

The concentration of R&D expenditure in the Madrid region continued to decline. While, in 1987, Madrid accounted for 45% of the total Spanish R&D expenditure, by 1997 it had declined to 32%.

This decrease is observed both in the business enterprise sector (following the privatisation of the former State-owned enterprises, which pursued R&D in the capital) and in the government sector. The decrease in the government sector is not real but the result of better regional distribution of public resources for R&D.

Catalonia's share of R & D expenditure (20%) has remained virtually stable over the last ten years. Regions with a comparable ranking are Andalusia (10% of total expenditure on R&D) and the Basque Country (9%).

Within each autonomous Community, however, the operators are different. Thus, in Madrid in 1997, 52% of R&D was conducted by BES and 27% by the government sector. In Catalonia, most R&D is pursued by BES (63% of Catalan R&D) and universities (24%) sector. In Andalusia, given its sparse industrial fabric, the universities are the driving force behind R&D activity (58% of R&D in Andalusia). In the Basque Country, R&D is particularly concentrated in BES (78% of Basque R&D), while the public sector accounts for a mere 2.7% of R&D pursued in that Community. This peculiar sectoral breakdown in the Basque Country is due to the Basque government's policy of overseeing and financing research companies and associations instead of setting up public regional research bodies.

When regional R&D expenditure is expressed as a proportion of its respective GDP, Madrid still remains the most active region in pursuing R&D activities. In 1996, Madrid allocated 1.80% of its GDP to R&D expenditure, followed by the Basque Country (1.31%) and Catalonia (0.95%). They are the only regions above the national average (0.87%).

Nevertheless, examining the development of the different Autonomous Communities over the period 1987-1996, a greater degree of convergence is observed between the various regions and the national average for R&D. If national expenditure on R&D set against Spain's GDP equals 100, in 1987 eight regions were below 50% of the national average, whereas, in 1996, only four Communities (Balearics, Castilla-La Mancha, Extremadura and La Rioja) fell below half of the national average.

FRANCE

R&D expenditure

Concentration of R&D work in Île de France continues to decline. In 1996, this region accounts for 40.5% of all R&D expenditure (the non-distributed part represents 16.1% of gross domestic expenditure on R&D (GERD)) compared with 43.3% in 1992. A number of sectors contribute to this trend, particularly businesses whose expenditure is decreasing in this region for the second year.

In 1996, the Paris region accounted for 49% of BES R&D (BERD) compared with 51% in 1995. The concentration of R&D activities in Île de France has therefore declined, which is further evidence of the trend observed for several years. In 1995, the region saw, for a second year, its domestic R&D expenditure decreasing in terms of value. Most of the other regions benefit from an increase in the relative share of their R&D expenditure in the national total, but it is mainly in the regions Rhône-Alpes and Provence-Alpes-Côte d'Azur where the share has increased regularly since 1992.

R&D personnel

For publicly funded research, it is preferable to base the calculation on the number of research staff, since the distribution by region of R&D expenditure by universities is not available.

37.6% of the almost 70,000 researchers, researcher-teachers and grant holders in publicly funded research are remunerated in Île de France (excluding Defence and non-profit-making associations). This rate was 39.9% in 1992. This average rate is due to the fact that there are more researchers in the region working for the CNRS group and public bodies (just under half in both cases) than there are researcher-teachers at the universities (a quarter of the staff). The establishment of universities is in fact much more uniform than that of research bodies.

The concentration of R&D staff in the various regions is actually much the same in the public sector as it is in businesses. In both cases, the leading region is Île de France (more than 110,000 R&D

staff), where there is an even greater concentration of business-based researchers (51.1% in this region alone compared with 37.6% for the public sector). The Rhône-Alpes region includes 10.6% of all R&D staff. Provence-Alpes-Côte d'Azur (6.5%) and Midi-Pyrénées (5.1%) come second, followed by Languedoc-Roussillon, Aquitaine and Brittany with 3 to 4% of the staff. These are followed by regions such as Alsace, Pays de la Loire, Lorraine, Nord-Pas-de-Calais, Centre and the Auvergne, each with between 2 and 3% of the total research staff.

FINLAND

R&D expenditure

A total of approximately FIM 17.3 billion was spent on R&D in 1997. From 1995 to 1997, the average annual nominal increase was 16%. The growth in the R&D expenditure continued through 1998, when it is estimated to reach FIM 19.7 billion.

In 1997, the R&D expenditure of enterprises amounted to slightly under FIM 11.4 billion, or two thirds of all R&D expenditure. The enterprises sector experienced a rapid growth in R&D expenditure. From 1995 to 1997, the annual nominal increase was 18%. Enterprises' R&D expenditure is estimated to grow by a further 17% and reach a total of FIM 13.3 billion in 1998.

In 1997, the R&D expenditure of universities and central university hospitals amounted to FIM 3.4 billion, i.e. one fifth of all R&D expenditure. The R&D expenditure of the rest of the public sector amounted to FIM 2.4 billion.

Finnish R&D expenditure as a proportion of GDP has continuously been increasing since 1987. In 1997, 2.8% of the GDP was allocated to R&D activities as compared to 1.8% in 1987. The proportion of GDP allocated to R&D expenditure is expected to reach 3% by 1998.

In 1997, Finnish enterprises accounted for 61% of all R&D financing. This is 6% points more than in 1993. From 1993 to 1997, the proportion of foreign financing has increased even more, and has gone up from 1.8% to 5.4%. This is mainly attributable to growing EU financing.

In the electrical industry, R&D spending in 1997 amounted to a total of FIM 5.4 billion, which is nearly one half of all the R&D expenditure of enterprises. The annual nominal growth of R&D expenditure in the electrical industry is estimated to continue at 27% in 1998, which will raise the total R&D expenditure of this branch to approximately FIM 6.8 billion.

In the metal and engineering industry, R&D expenditure increased from FIM 1.3 billion to FIM 1.7 billion between 1995-97. R&D expenditure in the chemical industry totalled FIM 1.2 billion in 1997, with the annual nominal growth between 1995-97 amounting to an average of 4%.

R&D personnel

In 1997, enterprises employed in R&D a total of 29,100 persons, who produced a total of 22,300 FTE. Compared with 1995, the number of R&D personnel increased by 20%, while FTE went up by 25%.

UNITED KINGDOM

R&D expenditure

In 1997, GBP 9.6 billion was spent on R&D performed within UK Businesses - a rise of 2% at current prices compared with the revised 1996 total. In real terms (using the GDP deflator) expenditure decreased by 1% and in 1997 represented approximately 1.2% of GDP.

The South East remained the area with the largest R&D expenditure within the Business Enterprise Sector, with 31% of the UK total of GBP 9,553 million. The second largest region was East Anglia with 24% of the UK total. In comparison, the areas with the smallest R&D expenditure in England were the North and also Yorkshire & Humberside. These regions represented 2% and 3% of the UK total, respectively.

The product group with the largest R&D expenditure was pharmaceuticals; expenditure in 1997 was GBP 2,151 million, 23% of all spending. Other major product groups were motor vehicles and parts accounting for GBP 963 million (10%) and aerospace GBP 893 million (9%).

Funding of R&D in UK businesses by the EU Commission through its schemes to support R&D in the European Union amounted to GBP 117 million in 1997. Other funding from overseas (i.e. excluding funds from the EU Commission) was GBP 1,739 million. Funding from the UK Government was GBP 927 million. Funding of R&D from businesses own funds was GBP 6,103 million in 1997 (64% of the total).

NORWAY

R&D expenditure

According to the latest survey Norwegian gross domestic expenditure on R&D (GERD) amounted to NOK 18,187 million in 1997, representing 6.5% increase from 1995 (at constant prices). Thus, Norwegian GERD makes up 1.68% GDP, which is a slight decrease from 1995 (1.71%).

Almost half of the Norwegian GERD in 1997 was performed in the central eastern part of Norway, i.e. in the capital, Oslo, and adjacent areas. The largest university and several large enterprises and government institutes are located here. Western Norway and Trondelag account for 12% and 13% respectively. The Trondelag share is mainly made up by the Technical University of Norway and the SINTEF Group. In the other end, the three northernmost counties account for only 5% of GERD.

Business enterprise expenditure R&D (BERD) accounted for 57% of Norwegian GERD in 1997, while the Higher Education and Government sectors held shares of 27% and 16% respectively.

2.5. STANDARD DEFINITIONS AND EXPLANATORY NOTES

The standards used

The basic methodological recommendations for R&D statistics are given in the "Proposed Standard Practice for Surveys of Research and Experimental Development – Frascati Manual" (OECD, 1994). This manual deals exclusively with the measurement of R&D "input". The regional aspects of R&D and innovation statistics are covered by "The Regional Dimension of R&D and Innovation Statistics – Regional Manual" (Eurostat, 1996). The following definitions are mainly derived from these manuals. In principle, the R&D data in this publication are being collected in line with these recommendations. The basic data are collected by the relevant authorities in the MS (National Statistical Offices, Research Councils, and Ministries responsible for R&D). These data are transmitted to Eurostat where the data are checked, transformed, and where the derived indicators are calculated.

Research and Development – R&D

Research and experimental development (R&D) comprise creative work undertaken on a systematic basis in order to increase the stock of knowledge, including knowledge of man, culture and society and the use of this stock of knowledge to devise new applications (Frascati Manual, § 57). This term covers three activities: basic research, applied research, and experimental development.

Measures for R&D input

According to the recommendations of the Frascati Manual and the Regional Manual, the following indicators for R&D input statistics are compiled in this publication:

- Government budget appropriations or outlays on R&D – GBAORD
- R&D expenditure
- R&D personnel

Comparability problem

Although the R&D expenditures and R&D personnel data are collected by surveys which follow the guidelines and definitions outlined in the Frascati manual, the data are not completely comparable. Differences in interpreting the definitions, utilisation of different survey methodologies and peculiarities of national R&D systems.

R&D personnel problems occur mainly with calculations of full-time equivalent (FTE). In order to collect the FTE for certain employee groups such as R&D managers or graduate staff, the proportion of work undertaken on R&D has to be estimated for each individual, and the methods of estimation may differ from one country to another.

Full-time equivalent – FTE

An FTE may be thought of as one person-year. Thus, a person who normally spends 30% of his or her time on R&D and the rest on other activities (e.g. teaching, administration or student counselling) should be counted as 0.3 of an FTE. Similarly, if a full-time R&D worker is employed by an R&D unit for only 6 months, he or she is counted as 0.5 of an FTE.

Head Count – HC

HC data measure the total number of persons who are mainly or partially employed on R&D. This allows links to be made with other series of data (education, employment). In this publication, HC data are used to calculate the more comparable derived indicator “R&D personnel as a percentage of labour force”. Not all countries collect R&D personnel in HC. In this case, the HC data are estimated by Eurostat.

Breakdown by institutional sector

Both intramural R&D expenditure and R&D personnel are broken down by institutional sector, i.e. the sectors in which the R&D is performed are specified. Four sectors are relevant in the context of this publication where indicators for R&D performance are compiled: the business enterprise sector, the government sector, the higher education sector, and the private non-profit sector.⁵

Business enterprise sector – BES

In the field of R&D the business enterprise sector includes (Frascati Manual, § 145):

- all firms, organisations and institutions whose primary activity is the market production of goods and services (other than higher education) for sale to the general public at a price intended approximately to cover at least the cost of production;
- the private non-profit institutes mainly serving them.

⁵ In other publications (e.g. by OECD) where data are also compiled by source of funds the sector “abroad” is also relevant.

Government sector – GOV

In the field of R&D the government sector includes (Frascati Manual, § 168):

- all departments, offices and other bodies which furnish but normally do not sell to the community those common services (other than higher education) which cannot otherwise conveniently and economically be provided, and those which administer the state and the economic policy of the community (public enterprises are included in the business enterprise sector);
- the private non-profit institutes controlled and mainly financed by government.

Higher education sector – HES

In the field of R&D, the higher education sector includes (Frascati Manual, § 190):

all universities, colleges of technology and other institutes of post-secondary education, whatever their source of finance or legal status. It also includes all research institutes, experimental stations and clinics operating under the direct control of or administered by or associated with a higher education establishment.

Private non-profit sector – PNP

In the field of R&D the private non-profit sector includes (Frascati Manual, § 178):

- non-market, private non-profit institutions serving households (i.e. the general public);
- private individuals or households.

Due to its rather marginal relevance, there are no tables compiled for the PNP. The difference between the total of sectors and the sum of BES, GOV, and HES equals the PNP. For some countries, the PNP is included in the GOV.

CHAPTER 3: European patent applications

Introductory remark

Technological change and innovation are important factors for productivity and competitiveness. Within the innovation process, R&D is considered to be one decisive element. Patents are often linked to R&D and can be considered as indicators for R&D output, especially for application-oriented types of R&D. Patents give an indication of the structure and evolution of innovative activities in countries, regions, or industries. Although not all applications are granted, however, each application still represents technical effort by the inventor and is therefore considered to be an appropriate indicator for the inventive potential.

Patents are a means of protecting inventions, which have been developed by enterprises, institutions or organisations, in order to benefit from an invention or innovation. Over the years, many R&D output indicators have been developed, each of which have different characteristics. However, the most commonly used R&D output indicators are based on patents.⁶

Eurostat regional patent applications database contains data from 1989 to 1998. Both 1997 and 1998 data should be considered as provisional. Euro-PCT filings enter the EPO's database at the moment of publication, i.e. 18 months after priority date (Patent Co-operation Treaty –PCT, see below). A large part of the Euro-PCT applications filed in 1997 and 1998 has not been published yet. 1997 data are not fully available before the second half of 1999 and 1998 data will not be fully available until second half of 2000.

3.1. PATENT ACTIVITIES IN THE EU

EU-15 patent applications in 1998 are 24% above the 1990 level

The numbers of patent applications filed by the EU-15 with the EPO and Euro-PCT (applications in their international phase) have been increasing at a steady rate with the exception of 1991.⁷ Since 1990, the EU-15 patent applications have grown at an average annual rate of 2.7% and in 1998, approximately 40,023 patent applications were filed by the EU-15. Figure 15 shows that in spite of a substantial decrease in 1991, the numbers of patent applications in 1998 are some 24% above the 1990 level. The long-term trend of the euro-zone is similar to the EU-15.

Germany, the most active Member State in European patent applications

Figure 16 shows the shares of the 1998 EU patent applications of the individual Member States. There are major disparities in the shares of the patent applications between the Member States. Germany clearly stands out from the rest of the EU Member States with its large share of 42.7%

(17,090 patent applications), which is more than the combined total of the other three big EU countries (France, the United Kingdom, and Italy). Germany, France and the United Kingdom are the

⁶ There are advantages and disadvantages in using data on patents as a science and technology indicator. The data relating to (European) patent applications in this publication refers to those filed with or designated to the European Patent Office (EPO). Using data from the EPO guarantees the comparability of the data as all applications filed with the EPO follow the harmonised procedure of the European Patent Convention (see below). Furthermore, due to the efforts and costs involved with patenting, the economic weight of the patent applications is guaranteed to a large extent. On the other hand, there are differences in the propensity to patent across enterprises, branches, and countries. Other means to reap market success from an invention, such as secrecy, rapid launching or low prices, also exist. For instance, in areas where developments change rapidly, patent protection may be of little value because inventions quickly become obsolete. Furthermore, not all inventions can apply for patent protection, for example, computer software. The requirement of novelty for the granting of patents means that although the indicators are particularly appropriate for advanced countries, they may not adequately portray technological activity in less developed countries and regions.

⁷ The decrease in the number of patent applications in 1991 can be explained to a large extent by an increase in EPO fees on January 1, 1991 which led to a rush of applications in the previous year.

three dominant countries in EU patenting. In 1998 they accounted for 70.4% of the EU total. However their 1998 shares are lower than their respective 1990 shares, which is in contrast to the performance of the rest of the EU Member States.

Figure 15 : Trends of the EU patent applications (EPO), 1990-98

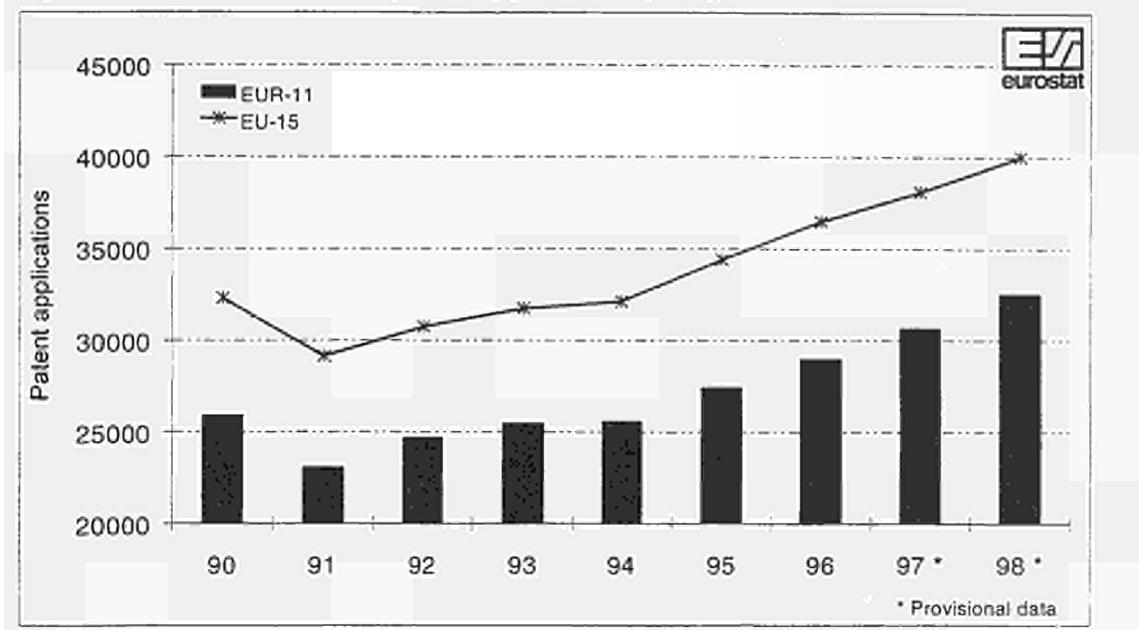

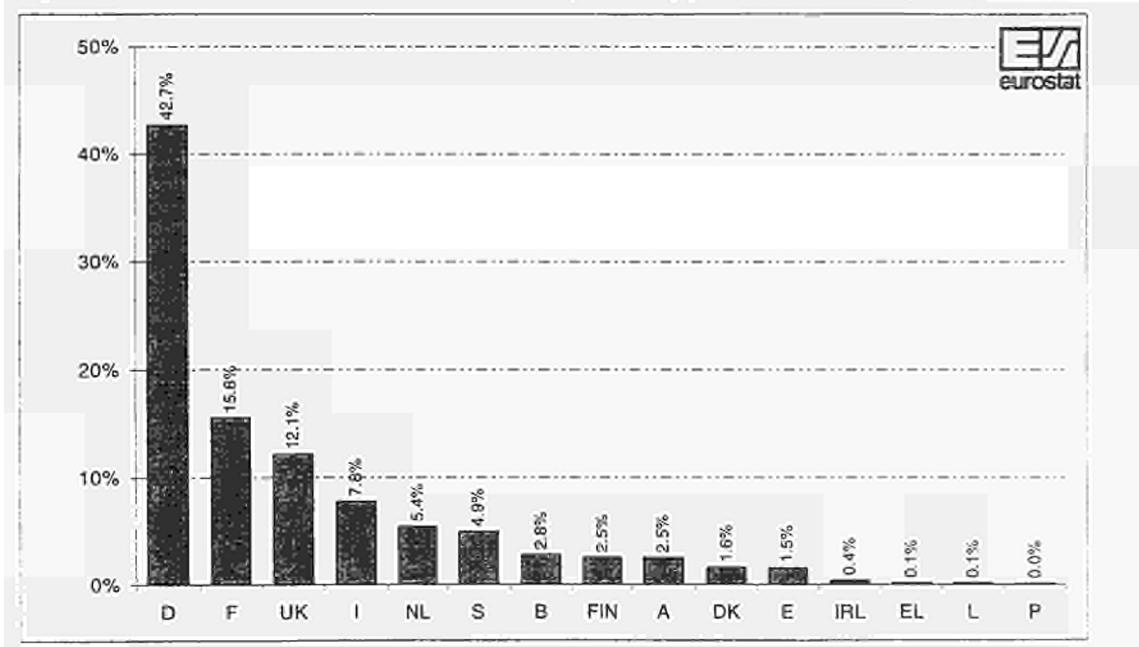

Figure 16 : Member States share of the EU patent applications at EPO, 1998

Average annual growth rates of patent applications (figure 17) of most EU countries are well above that of the EU-15 average. Between 1990 and 1998 Portugal (17.8%) recorded the largest increase in patent applications, followed by Spain (10.4%) and Finland (8.9%). In contrast, the growth rates of the big three large EU Member States (France, Italy and UK) are below the EU average. Low patenting countries such as Spain, Ireland and Finland have performed exceptionally well during the 1990-98 period. In 1990 Portugal and Spain accounted for a mere 0.02% and 0.87% of the EU patent applications, but they achieved high annual growth rates over the 1990-98 period. In contrast Germany, France and the United Kingdom accounted for 42%, 17% and 15% of EU patent applications, but their growth rates were a mere 2.8%, 1.6% and 0.3% respectively.

Figure 17 : Average annual growth rates of patent applications at EPO, 1990-98

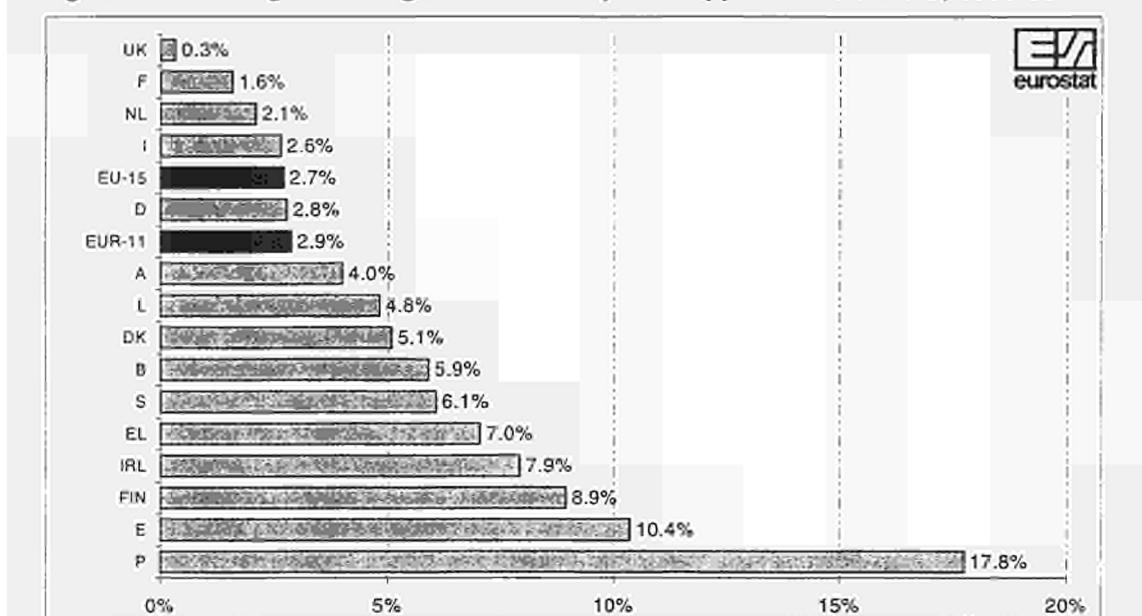

Table 15 : Ranking (number) of patent applications in 1998

Eurostat	Rank	Number of patent applications per MLF	Rank	Number of patent applications
S	1	453	6	1 977
D	2	420	1	17 090
FIN	3	400	8	998
NL	4	285	5	2 167
L	5	276	14	48
B	6	262	7	1 106
A	7	262	9	997
F	8	246	2	6 227

UK	10	169	3	4 850
I	11	136	4	3 104
IRL	12	94	12	144
E	13	38	11	618
EL	14	12	13	50
P	15	4	15	20
EU-15	-	234	-	40 023
EUR-11	-	249	-	32 517

Note: 1998 Patent applications per million labour force indicator is an Eurostat estimation.

234 European patent applications per million labour force were filed by the EU in 1998

Analysing patent applications in terms of absolute numbers may not give an unbiased indication of patenting activities of the EU Member States. For a more comparable portrait of patent activities data are expressed in terms of per million labour force (MLF) and per million population (MP). Ranking of the European patent applications in terms of labour force and population are almost identical.

Comparing the ranking in terms of labour force rather than absolute numbers depicts a different picture for the high patenting countries, but for the low patenting countries the ranking remains the same. Sweden (453, MLF) is the most active EU Member States, followed by Germany (420, MLF) and Finland (400, MLF). The ranking of France declined from second to eighth, although its' 1998 figure (246 MLF) is above the EU-15 average. In contrast, the UK declines from third position to tenth and its recorded figure (169 MLF) is well below the EU-15 average (see table 15).

3.2. PATENT APPLICATIONS BY IPC SECTIONS

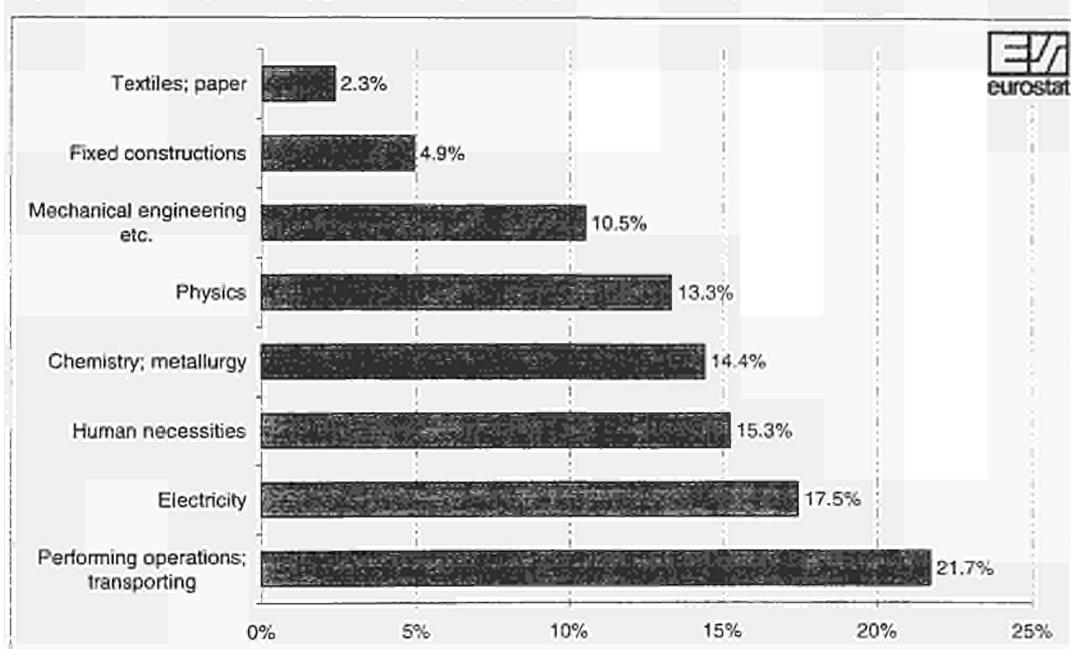

The International Patent Classification (IPC) is used to classify patent applications by field of technology. The IPC divides all technological fields into eight sections. To a considerable extent, the IPC employs the principle of classifying inventions according to their intrinsic nature (the functional-oriented), rather than their possible applications.

Performing operations & Transporting (21.7%) is still the dominant sector

In 1998 the largest numbers of patent applications filed by the EU-15 appear in Performing Operations & Transporting, followed by Electricity and Human Necessities section. Patenting activities of the EU-15 in the Chemistry & Metallurgy also appear quite strong; in contrast, Fixed Constructions and Textiles & Paper sectors account for a relatively small proportion of the EU total (figure 18).

Shares of each IPC-sectors have remained more or less stable since 1990. At individual EU country level, most EU Member States filed the largest proportion of their patent applications either for the human necessities section or for the performing operations transport section. The exceptions being the Netherlands, Finland and Sweden, whose largest share was accounted by the electricity section. The share of the patent applications accounted by the largest IPC section varies from 40% (Luxembourg and Finland) to 18% (Belgium and the United Kingdom).

Figure 18 : EU patent applications (EPO) by IPC sections, 1998

3.3. REGIONAL DISTRIBUTION OF THE EU PATENT APPLICATIONS

Introductory remark

To obtain an indication of the regional potential of innovation within the EU, the regional distribution of the patent applications is assigned according to the address of the inventor, i.e. the inventor's place of residence. This approach follows the methodological recommendations as given in "The Regional Dimension of R&D and Innovation Statistics – Regional Manual" (Eurostat, 1996). The assignment by the inventor's place of residence has been chosen in order to measure the inventive capacity of a region in contrast to the regional R&D performance.⁸

Baden-Württemberg filed for 794 patent application per MLF in 1998

There are significant disparities in the patenting activities between EU regions even within a country. In terms of absolute patenting numbers, the five most active regions (NUTS level 1) accounted for around 38% of the total EU-15 patent applications. German regions tend to be dominant force in European patenting (four German regions in the top five). Of the five leading regions, Bayern recorded the largest average annual growth rate (4.5%), whereas Île de France (the only non German region in the top five) recorded the smallest growth rate (0.9%) between 1990-98.

For a more comparable regional portrait, patent applications are expressed in terms of per million labour forces (MLF), which show a similar picture of the German regions (four German regions in top five – see table 16).

Table 16 : The five most active patenting regions in 1998 (patent applications per MLF)

 Region	Country	Rank	No. of patent applications / MLF	Rank	No. of patent applications
Baden-Württemberg	D	1	794	2	4 018
Bayern	D	2	677	1	4 071
Zuid-Nederland	NL	3	583	10	985
Hessen	D	4	563	5	1 611
Rheinland-Pfalz	D	5	495	11	904

Large regional disparities for patent applications within individual EU Member States also exist. Este is the most active Spanish region (66 patent applications per MLF), but in comparison to Baden-Württemberg, it is approximately twelve times less active. The propensity to patent between the most active and least active regions within individual countries varies from a factor of 23.3 (Germany) to 1.6 (Austria).

⁸ The regional R&D performance could be indicated by allocating the patents to the region of the institution in which R&D is performed and where inventions are developed. However, for institutions with several branches located in different regions, patent applications are generally filed through the headquarters and, therefore, an over-estimation in favour of the region of the headquarters could be expected. The approach used here avoids this. However, some underestimation of the regional potential of innovation is still possible, as not every inventor will register under the address where he is resident but rather the address of his enterprise or institution. If one application has more than one inventor, the application is divided equally among the inventors and therefore subsequently among the regions. This might lead to some over- or underestimation of some regions as the different contributions of several inventors cannot be considered to have the same weight. In this report, only applications with at least one inventor having his place of residence within the EU are considered. Shares of applications assigned to inventors with an address outside the EU are disregarded.

3.4. STANDARD DEFINITION AND EXPLANATORY NOTES

Overview on the database used for patent application statistics

The data on patent applications compiled in this publication is an extraction from the database of the European Patent Office (EPO). The criteria used for the data extraction refer especially to the regional potential for innovation. Therefore, the national totals of European patent applications presented in this report are somewhat different from those presented in the EPO's annual report.

Differences of definition between statistics on European patent applications presented by the EPO and by Eurostat

A short overview of the differences of definition between the statistics on European patent applications compiled in this publication and the statistics on European patent applications presented in the EPO's Annual Report is given below.

As already mentioned, Eurostat's regional statistics refer to applications filed directly under the European Patent Convention or to applications filed under the Patent Convention Treaty and designating the EPO (Euro-PCT). Applications are counted according to the date of filing. The EPO annual report presents statistics on applications filed directly under the European Patent Convention, counted according to the date of filing, and applications filed under the Patent Convention Treaty counted according to the date of filing or according to the date of entrance in the regional (European) phase.

According to the regional statistics, a patent application is allocated to the region where the inventor is resident. If one application has more than one inventor, the application is divided equally among the inventors and subsequently among the regions (fractional counting). This allocation procedure is different from the one used for the EPO's report, where the statistics are recorded by the country of residence of the first applicant. The entire application is assigned to the first applicant.

The data on European patent applications contain information on the field of technology by the IPC. Eurostat statistics divide an application among all IPC-subclasses indicated (fractional counting). The EPO statistics are different. Here, one application is fully counted in the first subclass indicated.

The patent application procedure

There are different ways to file a patent application. Usually, a patent application is initially filed with the national patent office of the country in which the inventor's laboratory or company is located. The patent application is then provisionally protected until examination of the application is complete, and the patent is either granted, rejected or withdrawn.

For various reasons, it could be worthwhile to apply for patent protection in other countries as well. Within one year, the same invention can also be filed in other countries. This can either be done by filing for a patent in each desired country, or by filing a regional application (e.g. with the EPO), or by filing an international application (under the Patent Co-operation Treaty - PCT) to obtain protection in various countries. The PCT-system is superimposed upon the national and European systems. Therefore, a PCT-application may designate either to national patent offices or to a regional one like the EPO. These so called Euro-PCT filings apply for protection in a set of European countries.

Besides the possibilities outlined above, direct filing for several countries either under the PCT-route or with the EPO (Euro-direct application) is also possible. In all cases, the protection starts from the date of filing the application.

Patent applications covered

The regional statistics refer to applications filed directly under the European Patent Convention or to applications filed under the Patent Convention Treaty and designating the EPO (Euro-PCT). Applications are counted according to the date of filing.

Coverage

Data on patent applications are compiled for all 15 EU countries that were Member States of the European Patent Convention in 1998.

Filings are indicated yearly from 1990 to 1998. The 1998 figures should be considered as provisional. Euro-PCT filings enter the EPO's database at the moment of publication, i.e. 18 months after priority date (Patent Co-operation Treaty - PCT, see below). A large part of the Euro-PCT applications filed in 1998 have not been published yet. 1998 data are not fully available before the second half of 1999.

Classification of patent applications

The applications are classified according to the International Patent Classification (IPC, see below). Usually, one application is assigned to more than one IPC-code. The most detailed reference class for our purposes is at subclass level. If more than one subclass is mentioned, the application is divided equally between all indicated subclasses.

IPC – International Patent Classification

The International Patent Classification (IPC) is a retrieval system for inventions claimed in patent documents. The classification is designed so that each technical object to which a patent relates can be classified as a whole. A patent may contain several technical objects and therefore be designated to several IPC-classes. The IPC-class indicates the field of technology. An invention is assigned to an IPC-class by its function or intrinsic nature, or by its field of application. IPC is therefore a combined function-application classification system in which the function takes precedence. Its structure is tiered into sections, classes, subclasses, groups and subgroups.

PCT – Patent Co-operation Treaty

The PCT allows for a filing of an international application to have the same effect as a national application in each of the contracting countries designated in the application. However, patents are still granted nationally. The PCT system is superimposed upon the national and European systems. In PCT-applications, the applicant may either designate a country, or a regional office such as the European Patent Office (EPO). These so called Euro-PCT filings may then apply for protection in a number of European countries.

For a patent application filed under the Euro-PCT route, two phases are identified - the *international phase* and the *regional (European) phase*. During the international phase, a search is carried out and, on the request of the applicant, a preliminary examination can be done. Eighteen months after priority date (the date of the very first filing), the application is published, and two to three years after the priority date (one to two years in most of the cases), the application, if not withdrawn, enters the

regional (European) phase. Here, formal search and substantive examination are undertaken, ending with the application being either granted, refused, or withdrawn by the applicant.

European Patent Convention (Munich Convention)

The European Patent Convention, signed in Munich in October 1973, establishes a uniform patenting system for all countries signatory to the Convention. The European patenting procedure consists of two parts; firstly, the search followed by publication of the application, and secondly, the examination which is only conducted after a formal request by the applicant. The applicant can designate as many contracting states as he wants at the moment of filing the application or at the moment the Euro-PCT enters the regional (European) phase. A granted European patent is protected under national law in each of the countries designated in the application.

Twenty-one countries attended the Munich Diplomatic Conference in 1973 on which the Convention is based. Up to 1997, eighteen countries were Member States of the European Patent Convention: Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Liechtenstein, Luxembourg, Monaco, Portugal, The Netherlands, Spain, Sweden, Switzerland, and The United Kingdom. In December 1997, the Cypriot parliament approved the country's accession to the EPC and since April 1998 Cyprus has been the nineteenth country of the organisation. Norway has signed the Convention but not yet ratified it. On November 1997 the former Yugoslav Republic of Macedonia became the sixth country to join the extension system after Albania, Latvia, Lithuania, Romania and Slovenia.

PART B:

TABLES AND NOTES RELATING TO THE TABLES

NOTES RELATING TO THE TABLES

T.1. TABLES ON GOVERNMENT R&D APPROPRIATIONS

Because of national revisions, some of the data shown for government R&D appropriations deviate from the figures in previous issues of this publication. Even in the case of derived indicators there are differences compared with previous issues, since the values of the reference parameters, such as the implicit GDP price index or the volume of the central government budget, have been revised for at least some countries and years. In interpreting the tables, some (national) peculiarities still have to be borne in mind, and the most important of these are indicated below.

- Denmark: Up until 1992, GBAORD data also contain some non-government resources. This has been changed in 1993. The effects of this methodological change are not known, but comparison of the data for the period before 1992 with the data from 1993 should be treated with caution. Data by NABS are being translated from the NORDFORSK chapters; therefore, the data cannot be divided into NABS-subchapters. GBAORD on Biotechnology, Information Technology, and on Developing Countries are underestimated as it is not always possible to separate all funds devoted to these objectives.
- Germany: As a result of the unification and the restructuring of the research landscape afterwards, there are breaks between 1990 and 1991 (final budgets) as well as 1991 and 1992 (provisional budgets) in the time series for government R&D appropriations. Another break in series occurs between 1995 and 1996 (final budgets) and 1996 and 1997 respectively (provisional budgets). This refers mainly to methodological improvements of the allocation of funds to and within NABS chapter 7, 10, and 12. The negative value in NABS chapter 12 is explained by a budgetary correction.
- Spain: Up until 1993, government R&D appropriations on general university funds have been estimated by applying a figure of 16% of total university budgets. This factor has been adapted in several steps to bring it closer to reality (20% in 1994, 25% in 1995). For 1997, "Energy" (NABS 5) includes the Spanish contributions to CERN.
- France: There is a break in series between 1991 and 1992. The figures for the period up until 1991 are not fully comparable with those of the following years because of two reasons: An improved methodology for compiling GBAORD data has been introduced, and the legal status of the France-Télécom and the GIAT industries has been changed.
- Ireland: The figures for government R&D appropriations in Ireland contain some non-government resources.
- Austria: Data on R&D appropriations are collected according to the OECD classification and translated to NABS; therefore, the data cannot be divided into NABS-subchapters.
- Finland: As a result of changes in methodology, there are breaks in the time series for Finland between 1990 and 1991 (due to the inclusion of pension fees in the labour costs), and between 1994 and 1995 (since 1995, universities and research organisations have to pay a rent for government buildings which was not the case before). Data on R&D appropriations are collected according to the OECD classification and translated to NABS, therefore the data cannot be divided into NABS-subchapters.
- Sweden: The methodology for measuring government R&D appropriations in Sweden has been subject to annual changes since 1991, so that a comparison of the data from 1990 to 1994 should be treated with caution. Up until 1994, the Swedish budgetary year refers to the period July - June. In 1995/96, the budgetary year has been changed to the calendar year (January - December). Due to this change, the budgets for 1995 and 1996 are estimations based on the budget for the period July 1995 until December 1996. The 1997 budget has not been analysed; therefore, the analyses of the 1998 provisional budget are compiled in the tables. Data on R&D

appropriations are collected according to the NORDFORSK classification and translated to NABS and therefore the data cannot be divided into NABS sub-chapters.

- UK: The budgetary year for central government differs from the calendar year.
- Norway: Data on R&D appropriations are collected according to the NORDFORSK classification and translated to NABS and therefore the data cannot be divided into NABS sub-chapters.
- United States of America: Because of differences in methodology, the figures for the United States of America are systematically underestimated, so that comparisons with other countries should be treated with caution. For instance, they contain no data on expenditure on general university funds and no capital expenditure.
- Japan: The figures for Japan are estimates made by the OECD Secretariat and recognised as official data by the Japanese Government. They underestimate expenditure on the social and human sciences and are thus only to some extent comparable with the data for other countries.
- European Commission: The European Commission's budgets for R&D do not include the European Development Fund's resources for technological research. These funds are shown in the national budgets of the Member States of the EU. Moreover, there is a break between 1989 and 1990 in the time series for the final budgets of the European Commission, since from 1990 onwards the *pro rata* administrative costs are no longer included in the data. An improved methodology has been adopted for the Fourth Framework Programme (1994-1998) data which allows for the distribution by NABS sub-chapter of data previously included in chapter 12 and the sub-chapters for General Research.

T.2. TABLES ON R&D EXPENDITURE

Because of national revisions, some of the data shown for intramural R&D expenditure deviate from the figures in previous issues of this publication. Even in the case of derived indicators, there are differences compared with previous issues where the values of reference parameters have been changed. In interpreting the tables, some national peculiarities still have to be borne in mind, and the most important of these are indicated below.

- Belgium: The R&D expenditure of the "Centres Sectoriels de Recherche Collective", a subsector of the business enterprise sector, could not be disaggregated to regional level up until 1993. It should also be noted that up until 1993, no figures were available for public undertakings in Belgium. However, from 1994 on, public undertakings do make part of the BES.
- Denmark: The delimitation of the government sector in Denmark does not agree entirely with the international methodological recommendations. Not all GOV data can be disaggregated to regions. Moreover, it should be noted that, in the BES, the figures for some regions of Denmark are combined with those of neighbouring regions for data protection reasons.
- Germany: Because of German unification, there is a break in the time series between 1990 and 1991. In general, the R&D expenditure is broken down in accordance with the location of employment of the R&D personnel. As an exception, the GOV data up until 1991 are broken down by the main location of the research institution. In 1992, a new survey concept including additional survey units has been introduced in the GOV; therefore, there is another break in series between 1991 and 1992. The total of GOV expenditure includes R&D expenditure of German research institutions located abroad. From 1992 onwards, data for the PNP are included in the GOV. Not all data can be allocated to regions. Due to modifications of the survey method, there is a break in the HES series between 1994 and 1995.
- Spain: The survey unit in the business enterprise sector is the undertaking. If an undertaking has several establishments in at least two different regions, the intramuros R&D expenditure of the undertaking is allocated to the regions concerned in accordance with the regional breakdown of the personnel. Only in 1986, the R&D expenditure of undertakings was allocated exclusively to the region in which the head office was situated. Part of the R&D expenditure in Spain cannot be

disaggregated to regional level. For the HES from 1992 onwards the personnel costs of technicians and other staff are included, and the estimation procedure for other current and capital expenditure has been improved. Both these changes result in a break in the time series.

- France: Due to the change of the legal status of France Télécom and the GIAT industries, there is a break in the time series between 1991 and 1992 so that comparisons of the figures for the period before and after 1992 should be treated with caution. Not all of the intramuros R&D expenditure (defence sector, some expenditure of the HES) can be disaggregated to regional level.
- Ireland: Regional data in the HES refer to NUTS 92.
- Italy: There is a break in the time series for Italy between 1990 and 1991. Up until 1990 the figures of the BES and the GOV represent the sum of intramuros and extramuros R&D expenditure, but from 1991 onwards only the intramuros R&D expenditure. The pre-1991 data for Italy are thus only partly comparable with those of other countries. The PNP sector does not exist in Italy.
- Austria: Not all data can be disaggregated to the regional level.
- Portugal: 1995 data have been revised. The revision of the data for 1995 is due to all the private non-profit institutes (PNP) which serve the BES have been reallocated to this sector of performance. Data have thus been revised for the PNP and BES in what concerns R&D expenditure and R&D personnel
- Finland: Between 1990 and 1991, there is a break in the GOV and in the HES due to the inclusion of pension fees attached to salaries. PNP data are included in the GOV.
- Sweden: The data of GOV and HES before 1997 refer to the fiscal year (July - June).
- UK: Sufficiently reliable regional data can only be produced at NUTS 1. The regional figures for the government sector are estimated on the basis of the data on R&D personnel in the individual regions. R&D of the National Health Service is included in GOV expenditure since 1991. In 1994, a new methodology has been introduced in the BES to improve the collection of regional data; therefore, no direct comparisons can be made between data up until 1993 and from 1994 onwards. Another methodological change occurred between 1995 and 1996.
- Norway: The regional breakdown is based on a national classification. No regional GDP data are currently available. PNP data are included in the GOV.
- United States of America: The intramuros R&D expenditure of the United States of America is slightly underestimated in comparison to the corresponding figures for other countries (due to differences in methodology). The US methodology is slightly different from the international recommendations. In the business enterprise sector, for instance, depreciation is shown instead of the gross capital expenditure.

T.3. TABLES ON R&D PERSONNEL

In comparison to earlier issues of this publication, there is a marked improvement in the data on which this issue is based. Some figures which previously had to be estimated are now available from surveys, while for others it was possible to improve the estimation procedure - for instance by using national conversion factors for the country in question. Because of these improvements and national revisions, some of the data shown for R&D personnel might deviate from the figures in previous issues of this publication. Even in the case of derived indicators there are differences compared with previous issues where the values of reference parameters have been changed.

In accordance with international recommendations, figures for R&D personnel are indicated not only in full-time equivalent but also in head count. Since information in both measures at the regional level and for each sector is only available for a few Member States (Denmark, Greece, Italy, Portugal,

Finland, Norway), the figures for the other countries have to be estimated in one or other of the two measures (full-time equivalent or head count).

The estimation procedure applied is based on sectoral factors for conversion between head count and full-time equivalent. In the case of some countries (Spain, France, Ireland, Sweden, Iceland) these factors can be calculated at national level for at least some sectors and some years, i.e. data are available at national level in both full-time equivalent and head count for these sectors and years. In this case the unknown data for the regions are estimated on the basis of the national factors without further modifications, i.e. it is assumed that the structure of the R&D personnel in the individual regions is the same as the structure in the Member State as a whole.

In all other countries, where sectors or years in which factors for conversion between head count and full-time equivalent cannot even be calculated at national level, the estimates have to be arrived at on the basis of factors for other years or countries. If these factors are missing for some - but not all - years for a particular country, factors from other years are used, i.e. it is assumed that the structures in that country have not changed - or at least not substantially - over the course of time. In those cases in which absolutely no information on the (average) relationship between head count and full-time equivalent is available for a particular country or sector, weighted arithmetic means of the factors for the other (available) countries and years are used. It is assumed that the structures do not differ fundamentally amongst the individual countries. Empirical studies of the data available, in particular from Denmark and Portugal, have shown that this assumption is by no means unrealistic.

In the case of those countries for which only data at national level in full-time equivalent are indicated, the information was taken from OECD sources.

In interpreting the tables, national peculiarities must again be borne in mind, and the most important of these are summarised below.

- Belgium: The R&D personnel of the "Centres Sectoriels de Recherche Collective", a subsector of the business enterprise sector, could not be disaggregated to regional level up until 1993. It should also be noted that up until 1993, no information was available on R&D personnel in public undertakings. However, from 1994 on, public undertakings do make part of the BES.
- Denmark: The delimitation of the government sector in Denmark does not agree entirely with the international methodological recommendations. There are currently no regional labour force data available at NUTS 3 level. This means that, for the Danish regions, no proportions of R&D personnel in the total labour force in the various sectors can be calculated. Some of the R&D personnel in the GOV cannot be allocated to the individual regions.
- Germany: There is a break in the time series between 1990 and 1991 because of German unification. In general, the regional breakdown is done in accordance with the location of employment of the R&D personnel. The GOV data up until 1991 are an exception as they are broken down by the main location of the research institution. In 1992, a new survey concept including additional survey units has been introduced in the GOV, therefore there is another break in series between 1991 and 1992. The total of GOV personnel includes R&D personnel in German research institutions located abroad. From 1992 onwards, data for the PNP are included in the GOV. Not all data can be allocated to regions. Due to modifications of the survey method, there is a break in the HES series between 1994 and 1995.
- Greece: There are duplications in the case of Greece because some R&D personnel are employed in more than one institute.
- Spain: Not all data can be allocated to the individual regions.
- France: The national and the regional data on R&D personnel refer to the personnel "remunerated by" the institutional sector. The total for all regions for the GOV and the HES (and hence the total of all sectors) thus differs from the values normally indicated for France as a whole (e.g. in OECD publications where the national totals are indicated as "working in"). Not all personnel data can be broken down by region (defence sector, some personnel in the HES). Due to the change of the legal status of France Télécom and the GIAT industries, there is a methodological break in the

time series between 1991 and 1992 so that comparisons of the figures for the period before and after 1992 are of very little value.

- Ireland: No regional labour force data are currently available at NUTS level 3. This means that, for the Irish regions, no proportions of R&D personnel in the total labour force in the various sectors can be calculated. Regional data in the HES refer to NUTS 92.
- Italy: The PNP sector does not exist in Italy.
- Austria: Before 1995, no regional labour force data are available. This means that no proportions of R&D personnel in the total labour force can be calculated.
- Portugal: 1995 data have been revised. The revision of the data for 1995 is due to some minor errors that were found in internal data on human resources in R&D in the GOV sector, which have been amended.
- Finland: There is a break in the series of the HES between 1990 and 1991 due to revised time budget coefficients. PNP data are included in the GOV.
- Sweden: Before 1995, no regional labour force data are available. This means that no proportions of R&D personnel in the total labour force can be calculated. Before 1997, the data of the HES and GOV refer to the fiscal year (July to June). Not all data can be broken down by region.
- UK: Sufficiently reliable regional data can only be produced at NUTS 1. The figures for the government sector do not include R&D personnel in the National Health Service and local authorities. In 1994, a new methodology has been introduced in the BES to improve the collection of regional data and, therefore, no direct comparisons can be made between data up until 1993 and from 1994 onwards. This applies also for 1995 to 1996.
- Norway: The regional breakdown is based on a national classification and not on the NUTS. No regional labour force data are currently available. This means that no proportions of R&D personnel in the total labour force can be calculated. PNP data are included in the GOV.

T.4. TABLES ON EUROPEAN PATENT APPLICATIONS

All data on European patent applications refer to the databases of the EPO. Therefore, the comparability of the data can directly be guaranteed. In this print publication, statistical tables are provided at NUTS level 1 and by IPC-sections. The data at NUTS level 2 and 3 and by IPC-subclasses (4-digit) are available in the CD-Rom version of this publication.

At an operational level, a patent application is assigned to a region by using relation tables from postal codes to NUTS level 3 codes. A new improved regional data processing method has been applied to regionalise the European patent applications data; hence the regional data reported in this publication may differ from the data reported in the previous publications.

Due to the differences in national postal code systems, the following particularities have to be considered:

- Denmark: A unique link between postal codes and NUTS regions does not exist for Denmark, therefore data are only available at the national level.
- Ireland: Due to the lack of postal codes for the whole of Ireland, data can only be provided at national level.
- UK: The UK uses a rather unique system of postal codes. The established relation table for the UK showed a lack of reliability and, therefore, no regional data are currently published.

Statistics in focus

To get straight to the heart of the matter and obtain an effective insight into the reality of the EU Member States, the series of documents entitled *Statistics in focus* offers you rapid and easy access to information on all current trends in Europe.

Statistics in focus: find out, understand and decide in confidence with:

- ★ harmonized, reliable and comparable data on each Member State of the European Union;
- ★ clear and concise comments and analyses;
- ★ charts and maps easy to understand;
- ★ the latest available data.

Statistics in focus is available as single copy or by subscription. Subscriptions are available for one single theme (except themes 7 and 9) or for the whole collection. *Statistics in focus* is available as printed version or as PDF-file sent by e-mail.

Prices on request from the Data Shop network (see end of the publication).

Eurostat essentials.....

Understand today's Europe to anticipate the future better

- ★ **Eurostat Yearbook:** a comprehensive statistical presentation supplemented by comparative data for the EU's main trading partners (CD-ROM version available).
- ★ **Money, finance and the euro: Statistics:** This monthly statistical document provides short-term series for a wide range of financial indicators such as interest rates, exchange rates, money supply and official reserves (quarterly CD-ROM version available).
- ★ **Europroms CD-ROM:** the only source of information in Europe to propose detailed and comparable data on output, external trade and the markets of several thousand industrial products.
- ★ **Services in Europe:** an overview of the companies active in the service sector including detailed sectoral, thematic and country analysis.
- ★ **Agriculture and fisheries: Statistical yearbook 1998:** the most important elements of Eurostat's publications on agriculture, forestry and fisheries in abbreviated form.
- ★ **Comext CD-ROM:** provides data on external trade on all goods imported into or exported from the statistical territory of the European Union or traded between the statistical territories of the Member States.
- ★ **Transport development in the central European countries (analysis of the trends for the years 1994 and 1995):** a statistical overview of transport in 11 central European countries, together with a review of data availability.
- ★ **Energy — monthly statistics:** With the help of graphs, these statistics cover updates of the principal statistical series characterising short-term trends in the energy sectors (coal, oil, gas, electrical energy).

New Cronos:

More than 160 million items of data in this macroeconomic and social database are available to all those who need high-quality statistical information for decision-making.

Regio:

Eurostat's database for regional statistics. Covers the main aspects of economic and social life in the Community; demography, economic accounts, employment, etc.

Comext:

The database for statistics on the European Union's external trade and trade between Member States. 11 000 products by year are covered with all partner countries (more or less 250).

Europroms:

The only source of information in Europe that supplies detailed and comparable data on output, external trade and markets of several thousand industrial products. It makes it possible to calculate in precise terms the domestic market for some 5 000 products for most EU countries.

For further information, contact the Eurostat Data Shop network or visit us on the Internet at: <http://europa.eu.int/eurostat.html>
