**SUMMARY REPORT
on the Investment Surveys 1956 - 1965**

AUGUST 1966

SUMMARY REPORT

**Capital expenditure and production potential
in the different areas of the Community**

from 1956 to 1965

August 1966

INTRODUCTION

The High Authority has regularly published midway through each year since 1956 a report giving the results of its survey as at January 1 on investment in the Community coalmining and iron and steel industries. The report is sent to the E.C.S.C. enterprises, to the members of the European Parliament, to the Government Departments responsible for the coal and steel sectors, to the employers' and workers' organizations, and to other persons and bodies directly concerned; it is also obtainable from the Publications Department of the European Communities.

In order to keep the statistical tables within manageable proportions, it has been found necessary in recent reports to omit the figures for some previous years, so that readers wishing to obtain a full picture of developments since 1956 were obliged to refer to a larger and larger number of reports. The present publication, which was compiled in conjunction with the evaluation of the January 1, 1966, survey, offers the relevant data in a more convenient form, giving once again the basic definitions adopted and recapitulating all the statistics shown, by producer areas and producer sectors, in the annual reports from 1956 to 1965, including more particularly

- (a) capital expenditure in each year from 1954 to 1964 ;
- (b) production potential as existing in each year from 1955 to 1965.

BASIC DEFINITIONS

To ensure that the figures obtained shall be comparable, the High Authority has adopted the following definitions.

I — INVESTMENT

(a) Capital expenditure

Capital expenditure means all expenditure shown or to be shown on the credit side of the balance-sheet as fixed assets in the year under review, except in respect of the collieries and pithead power-stations where the expenditure to be shown is that which would have been, or would be, entered on the credit side of the balance-sheet in accordance with Document AM 43 (*Directives relatives au calcul de l'amortissement des biens investis dans l'industrie charbonnière de la C.E.C.A.*), drawn up by the study committee of the coal producers of Western Europe (CEPCEO).

The term does not, however, cover the financing of workers' housing schemes, financial participation and all investment not directly connected with Treaty products (chemical and synthetic products other than the conventional by-products of coking-plants, castings, tubes, etc).

(b) Unit of account

The unit adopted is the *dollar* unit of account of the European Payment Union (E.P.U.) and subsequently that of the *European Monetary Agreement* (E.M.A.). Their equivalents in national currencies are given in the following table :

Country	Currency	Up to and including 1956	1957	1958	1959 and 1960	1961	1962 and onwards
Germany (F.R.)	DM	4.20	4.20	4.20	4.20	4.03 (4)	4.00
Belgium/Luxembourg	Bfr./Lfr.	50	50	50	50	50	50
France (1)	Ffr. (2)	350	377 (3)	420	4.937 (3)	4.937	4.937
Italy	Lit.	625	625	625	625	625	625
Netherlands	Hfl.	3.80	3.80	3.80	3.80	3.65 (5)	3.62

(1) And Saar up to July 5, 1959.

(2) N.F. as from January 1, 1959.

(3) Mean between official rate of exchange in force from January 1 to August 11, 1957 (350) and that in force from August 12 to December 31, 1957. (420).

(4) Mean between official rate of exchange in force from January 1 to March 3, 1961 (4.20), and that in force from March 4 to December 31, 1961 (4.00).

(5) Mean between official rate of exchange in force from January 1 to March 3, 1961 (3.80), and that in force from March 4 to December 31, 1961 (3.62).

(c) Capital-goods price indices

The statistics for the annual investment surveys are compiled from the enterprises' declarations at the ruling prices for the year concerned, the figures being converted into dollar units of account at the official rates shown above.

Although it is extremely difficult to work out capital-goods price indices applying to all the Community industries and countries, the High Authority's publication of 1963, *La C.E.C.A. 1952-1962 ; Résultats, Limites, Perspectives*, suggests (p.104) the following, basis 1961 = 100, and brought up to date for the succeeding years :

1952	1953	1954	1955	1956	1957	1958	1959	1960	1961	1962	1963	1964
81.6	80.5	79.9	82.1	85.4	89.9	92.9	94.9	97.2	100.0	104.8	109.7	116.3

The figures in this report can thus be converted to 1961 prices by applying the index for the year concerned to the annual expenditures recorded.

II — MINING INDUSTRIES

(a) Coal

Extraction potential. — The figures shown represent the net maximum output technically achievable, allowing for the performance capacity of the different installations at the collieries (underground, surface, washeries), and assuming that it is not impeded by marketing difficulties, strikes or manpower shortages.

A number of mines with a low output, including the German "small mines", have not been included as regards either capital expenditure or production potential. Their 1955 production worked at about 1 % of the total ; by 1965 the proportion had shrunk to about 0.7 %.

(b) Coke

Production potential. — The figures shown represent the maximum annual coke production achievable with the plant in operation at a given date, taking into account the minimum coking time technically allowable for the normal composition of the coking blend, with due regard to the state of the ovens and the performance capacity of the ancillary and auxiliary installations. It is assumed that a ready market and unlimited raw-material supplies are assured.

(c) Pithead power-stations

Maximum electric capacity of a power-station means the maximum electric power that could be produced throughout several hours of continuous operation with all plant in full working order and with adequate fuel stocks of normal quality, and assuming that there exist no restrictive external factors (fuel of inferior quality, shortage of cooling water, inadequacy of the network receiving the power produced, etc.), but taking full account of all plant limitations that may arise out of the maximum electric capacity of each component of the main plant and auxiliaries of the station.

The net output represents the maximum power that can be supplied, measured at the station busbars after deducting the electric power taken by the station auxiliaries and the losses in the station transformers, if any.

Current produced means the net production of electric current measured at the station busbars after deducting the electric current taken by the station auxiliaries and the losses in the station transformers, if any.

(d) Iron ore

Extraction potential. — The figures shown represent the maximum continuous output which can be achieved by each mine, allowing for the performance capacity of the different installations (underground, surface, ore-preparation plant where the ore is sold only after treatment) and for estimated manpower availabilities during the year under consideration.

Geographical breakdown : —

In the tables, the orefields other than those mentioned by name are

Central and Southern Germany: Sauerland-Waldeck, Lahn-Dill, Taunus-Hunsrück,
Upper Hesse ;

Other German fields : Dogger orefield, Kreide orefield.

III — IRON AND STEEL INDUSTRY

(a) Production potential

Sinter, pig-iron, crude-steel and rolled-products production potential means the maximum production which can effectively be achieved by all the different sections of the plant together, allowing for possible bottlenecks in one section holding up all the others. This maximum possible production is defined as follows.

"Maximum possible production is the maximum production which it is possible to attain during the year under normal working conditions, with due regard for repairs, maintenance and the usual holidays, employing the plant available at the beginning of the year but also taking into account both additional production from any new plant installed and any existing plant to be finally taken off production in the course of the year. Production estimates must be based on the probable composition ratios of the charge in each plant concerned, on the assumption that the raw materials will be available."

In the case of steels produced mainly from pig-iron, the production potential is estimated in respect of the blast-furnaces and steelworks as a whole and not each steelworks individually.

The capital expenditure of a number of very small iron and steel works has not been included in this survey : their production potentials have throughout the period 1955-65 represented a very small per centage of the Community total, varying from sector to sector but in general not exceeding 0.8 % for crude steel and 1.5 % for rolled products.

(b) Steelworks-owned power-stations

See "Mining Industries," Section II, c for definitions of maximum capacity and electric current.

(c) Geographical breakdown

In the tables, the producer regions other than those mentioned by name are

Northern Germany : Länder Schleswig-Holstein, Lower Saxony, Hamburg, Bremen ;

Southern Germany : Länder Hessen, Rhineland/Palatinate, Baden-Württemberg, Bavaria ;

Eastern France : Departments of Ardennes, Aube, Doubs, Haute-Marne, Meurthe-et-Moselle, Meuse, Vosges, Territoire de Belfort, Haute-Saône, Moselle, Bas-Rhin, Haut-Rhin ;

Northern France : Departments of Aisne, Nord, Oise, Pas-de-Calais, Seine, Seine-et-Oise, Seine-et-Marne, Somme ;

France - other areas : all other Departments.

(1) Pithead power-stations proper and other power-generating plant at mines.

(2) This table covers only power-stations proper and other power-generating plant which actually produced electric current from coal before January 1, 1956. Their load-hours per annum were calculated by dividing the annual output by the average maximum electric capacity (arithmetical mean between the electric capacity at the beginning of 1955 and 1956). A possible source of error arises where new power-stations had not yet been brought into operation and obsolete plant had not been closed down by July 1, 1955.

(3) Production started end 1955.

(1) Pithead power-stations proper and other power-generating plant at mines.

(2) This table covers only power-stations proper and other power-generating plant which actually produced electric current from coal before January 1, 1960. Their load-hours per annum were calculated by dividing the annual output by the average maximum electric capacity (arithmetical mean between the electric capacity at the beginning of 1959 and 1960). A possible source of error arises where new power-stations had not yet been brought into operation and obsolete plant had not been closed down by July 1, 1959.

(1) Pithead power-stations proper and other power-generating plant at mines.

(2) This table covers only power-stations proper and other power-generating plant which actually produced electric current from coal before January 1, 1965. Their load-hours per annum were calculated by dividing the annual output by the average maximum electric capacity (arithmetical mean between the electric capacity at the beginning of 1964 and 1965). A possible source of error arises where new power-stations had not yet been brought into operation and obsolete plant had not been closed down by July 1, 1964.

TABLE XI a - 11
Specific Consumption of Coal 1965 (2)

PITHEAD
POWER-STATIONS (1)

Technical Data

C = Output of electric current in '000,000 kWh

P = Maximum electric capacity in '000 MW (average at beginning 1965 - beginning 1966)

H = Load-hours per annum (1965)
