Center for European Studies Working Paper No. 100

Portuguese Ministers, 1851-1999: Social Background and Paths to Power

by
Pedro Tavares de Almeida
and António Costa Pinto

ABSTRACT

This paper provides an empirical analysis of the impact of regime changes in the composition and patterns of recruitment of the Portuguese ministerial elite throughout the last 150 years. The 'out-of-type', violent nature of most regime transformations accounts for the purges in and the extensive replacements of the political personnel, namely of the uppermost officeholders. In the case of Cabinet members, such discontinuities did not imply, however, radical changes in their social profile. Although there were some significant variations, a series of salient characteristics have persisted over time. The typical Portuguese minister is a male in his mid-forties, of middle-class origin and predominantly urban-born, highly educated and with a state servant background. The two main occupational contingents have been university professors - except for the First Republic (1910-26) - and the military, the latter having only recently been eclipsed with the consolidation of contemporary democracy. As regards career pathways, the most striking feature is the secular trend for the declining role of parliamentary experience, which the democratic regime did not clearly reverse. In this period, a technocratic background rather than political experience has been indeed the privileged credential for a significant proportion of ministers.

Regime discontinuities involving the replacement of the governing elite as well as the reshaping of fundamental institutions and values are a distinctive feature of the political history of modern Portugal. The purpose of this paper is to assess the impact of these successive regime changes on the composition and patterns of recruitment of Cabinet ministers – the core group of decision-makers – and to point out the most significant trends over time: i.e., from the mid-nineteenth century, when the Constitutional Monarchy was consolidated, until the present democratic regime.

PERIODIZATION AND NATURE OF REGIME CHANGES

In the political development of modern Portugal, five major regime changes can be identified: these chronological milestones are 1834, 1910, 1926, 1933 and 1974.

In the aftermath of the 1834 civil war, the old absolutist order was finally dismantled, giving birth to a new political context and social environment. The establishment of the Constitutional Monarchy introduced a limited representative democracy – with the franchise being restricted by the application of property qualifications – as well as many of the institutions of modern governance. The social configuration of the ruling elite changed, with the sharp decline of the aristocratic element and the increasing predominance of individuals from a middle-class background. This trend is very clear during the second half of the nineteenth century, as some figures show. Between 1851 and 1910, only about 14 per cent of all Cabinet ministers were nobles, and most of them had been ennobled after 1834. Since 1870, no Prime Minister has been drawn from the older Portuguese aristocratic families. Also, fewer than one tenth of all members of the Chamber of Deputies between 1851 and 1890 were members of the titled nobility (Almeida, 1995).

With the early years of the liberal regime being marked by successive violent conflicts between rival factions, a steady process of consolidation only began following a successful military coup in 1851 that led to an enduring 'elite consensus,' with a regular and peaceful rotation in power that was anchored in a stable two-party system. For this reason, 1851 is the starting point for our inquiry into ministerial recruitment.

The two main elite parties that emerged during the 1850s incorporated the existing political factions and diverse networks of local notables. They were typical patronage-oriented parties, which were increasingly reliant on access to governmental resources as the state bureaucracy and its activities expanded. Although these parties had a low level of formalization, with weak organizational structures and volatile electoral support, they played an increasingly important role in screening and selecting the political elite. Hence, fewer and fewer independent and unaligned parliamentarians were elected. Moreover, with the Prime Minister effectively being the leader of one of the parties, Cabinet membership was based on personal and partisan loyalty.

The existence of Cabinet as a specialized political institution and the central role of the Prime Minister (which was granted legal recognition in 1855) were both innovations established by the liberals during the 1830s (Tavares, 1909). According to the Constitution, the monarch was vested with the executive power – appointing and dismissing ministers at his discretion, and retaining prerogative powers to dissolve the elected chamber of the bicameral parliament. In practice, however, the Prime Minister was responsible for government policy and the selection of ministers, although he could ignore neither the monarch's personal antipathies nor the pressures exerted by the more influential leaders of his party. The principle of representative government also established a pattern of interaction between Cabinet and Parliament, with the former being derived from and controlled by the latter. Throughout the liberal period, however, the rules of the game were continuously subverted. In fact, the fate of a Cabinet did not depend on the legislative election results, since it was the Cabinet that 'made' the elections, which were thus converted, in Rokkan's terms, into a mere 'ritual of confirmation.' In short, the *political engineering* worked as follows: when a Cabinet was replaced – whether as the result of urban protest, opposition pressures, or by the mutual agree-

ment of political leaders – the new Cabinet held early elections through which it legitimated its own authority and secured control of parliament. By mobilising the state apparatus's coercive and distributive resources, and through a complex process of bargaining and trading-off with local notables, the party in office usually returned a large majority of deputies. Parliament was thus clearly subordinated politically, a fact that was underlined by the dominance of Cabinet in the law-making process (Tavares, 1909; Almeida, 1991).

Paradoxically, this perversion of the democratic rules did not affect Parliament's status as one of the central arenas for public discussion, and as the main channel for the selection and recruitment of the political elite. As we will show below, a parliamentary career was then an inherent feature of the *homo politicus*, and a major requirement for the attainment of senior leadership positions. It should also be noted that the persistence of high property qualifications for parliamentary candidates throughout this period resulted in a clear social bias in recruitment to the legislature, restricting access to elite positions to a small number of individuals. Hence, the relevance of family connections and oligarchic trends in the formation of the political elite (Almeida, 1995).

Naturally, the mechanics of power alternation noted above was only viable on the basis of a pact, explicit or not, between the two major dynastic parties. While the so-called 'politics of agreements' (to use the language of the time) enabled the durable pacification of political life, it did not prevent governmental instability completely – the average Cabinet life span during the Constitutional Monarchy was 17 months (see Table 2) – nor did it prevent the gradual erosion of the policy-making institutions' legitimacy once rotation in office had crystallized into a competition for private accumulation and the clientelistic distribution of valuable state-controlled resources. These delegitimating factors were, of course, exploited in the political campaigns of the republican counter-elite that emerged during the late 1870s and founded an active and well organized party that was to become an important force in the major urban centres.

Table 1
Number of cabinets and ministers, 1851-1999*

Period	Cabinets	Prime Ministers	Ministers[1]
Constitutional Monarchy (1851-1910)	42	22	174
First Republic (1910-26)	46[2]	31	243[3]

* Individuals who were appointed ministers in different political regimes.

A second regime change occurred in 1910 with the overthrow of the monarchy in a revolutionary coup led by republican officers aided by armed civilians. The establishment of the First Republic brought significant changes in the composition of the ruling elite. There was a clear discontinuity in respect of senior- and middle-ranking personnel (e.g. ministers, parliamentarians, prefects), and political recruitment was opened to a wider social spectrum that now incorporated a large number of people from lower middle-class backgrounds (Marques, 1967; 1991).

The new ruling elite seized power on the basis of a political program that focused on two main goals: democratization and secularization. The latter was pursued through the implementation of radical anticlerical policies, which created a religious-secular cleavage that was to have a negative impact on the regime's viability as it pushed the Church into a position of outright hostility. Democratization was to be achieved by the introduction, among other measures, of universal male suffrage and the establishment of a genuine parliamentary system. However, fearing that the Church and the monarchists would use an extended franchise to mobilize the peasantry, the republicans restricted the right to vote to literate adult males, with the result that the Republic's electorate was smaller than that of the Constitutional Monarchy. Nevertheless, it should be noted that, despite the restricted size of the electorate, the First Republic experienced periods of intense social and political mobilization, which were partly caused by the emergence of new socioeconomic cleavages.

The 1911 Constitution reinforced the role of Parliament – a bicameral legislature that was to be directly elected. The President was elected by Parliament and had no powers of dissolution, whereas the Cabinet was directly responsible to the legislature. The subordinate constitutional role of the President did not, however, prevent the incumbent from influencing the formation of Cabinets. In 1919, an amendment to the Constitution granted the President the power to dissolve Parliament. Yet, it was during the turbulent post-war period, when there were few parliamentary majorities and a profusion of coalition governments, that the legislature played a more active role in the making and breaking of Cabinets.

While a two-party system prevailed during the Constitutional Monarchy, the First Republic's political system can best be characterized as a 'dominant-party multiparty' polity. The Democ-

ratic Party, which inherited the organizational resources and Jacobin ideology of the original Republican Party (*Partido Republicano Português* – PRP) following its split in 1912, enjoyed almost complete electoral dominance – remaining in power, either alone or in coalition, for most of the First Republican period. The fragmentation and polarization of the political system during the post-war period, however, resulted in the emergence of several small and highly ideological parties that operated in both the parliamentary and extra-parliamentary arenas, thus weakening the Democratic Party's internal cohesion and leading to a decline in its popularity (Martins, 1998; Pinto, 1998).

Political instability and elite disunity were endemic features of this period, and they are clearly demonstrated in the figures on Cabinet longevity and ministerial turnover. The average lifetime of republican Cabinets was little more than four months (see Table 2), and 83.5 per cent of Cabinet ministers remained in office for less than one year (see Table 4). It is also significant that the short-lived First Republic is the political regime in Modern Portugal that holds the record in terms of the total number of ministers (see Table 1). Cabinet instability certainly had a detrimental impact both on the effectiveness of policymaking and on the viability of the regime itself (Schwartzmann, 1989; Lijphart, 1984).

A major source of the First Republic's instability was the succession of military conspiracies and coups, two of which led to short dictatorial interludes: the first in 1915 and the second in 1917-18. While the former of these dictatorships simply sought to wrest power from the Democratic Party and hand it to the conservative republican opposition, the latter, led by Sidónio Pais, attempted a complete regime change: soon "after coming to power, Sidónio exiled a good part of the republican elite, broke with the Constitution of 1911, and advanced the institutionalization of a plebiscitary presidentialist dictatorship" (Pinto, 1998: 10). The *sidonist* dictatorship could not however survive the assassination of its charismatic leader. Regardless of its specific traits, the military coup that led to the collapse of the First Republic followed this trail of praetorian interventions.

The collapse of the First Republic took place during the post-First World War wave of European democratic regime crises and breakdowns, and was caused by a heterogeneous conservative

military-civilian coalition rather than by a fascist party (Berg-Schlosser and Mitchell, 1999). Mainly right-wing republicans, the generals who led the 1926 *coup d'état* sought support from certain elements in the conservative and Catholic elites in the creation of the first dictatorial governments. Nevertheless, the military retained control of the majority of ministerial portfolios and local administrative posts until 1932. Successive political and economic crises, however, forced them to negotiate with those civilian elites several pacts conducive to the institutionalization of a new regime.

The New State that emerged out of the Military Dictatorship was consolidated during the 1930s under the leadership of António de Oliveira Salazar – a young university professor and member of the Catholic Party who had joined the government as Minister of Finance in 1928. From within the government, Salazar created a weak and elitist single party, the National Union (*União Nacional* – UN). This party never had any power over the government, as its main functions were those of exercising political control over and selecting the members of the National Assembly (*Assembleia Nacional* -– AN) and of the local administrations (Cruz, 1988; Schmitter, 1999).

The 1933 Constitution, a product of several compromises with the conservative military, formally maintained fundamental freedoms and ensured the direct election of both the President and the National Assembly, created a Corporatist Chamber with few powers, and ensured that the government was responsible only to the President. The actual operation of the New State's political system altered very little throughout its long existence. The most significant change occurred in 1959 when the method of electing the President was altered in the aftermath of a dissident general's Presidential campaign that had led, with support from the democratic opposition movement, to an unprecedented degree of popular mobilization. From that time on, the President was to be indirectly elected (Pinto, 1995).

Salazar was the manipulator of a perverted rational-legal legitimacy, and he made little use of charismatic appeals. His traditional Catholicism, combined with his juridical and financial education, distinguishes him from the other European dictators of this period. Cold and distant from both his ministers and his supporters, he cultivated a small circle of 'political counsellors' and stamped governmental and political management with his own style: an almost obsessive belief in centralization and interest in minutiae. Unlike the other dictators, who assumed personal responsibility for the most important portfolios, such as foreign policy, internal security, and the armed forces, Salazar took firm control of the more 'technical' ministries. The armed forces may have been the main threat to the institutionalization of Salazarism during the 1930s, yet the dictator succeeded, with the support of an ageing President, in overcoming the military elite when he became Minister of War in 1936. Nevertheless, some legacies of the Military Dictatorship remained visible well into the 1940s and 1950s with the continued presence of members of the armed forces as censors and prefects and at the most senior levels of the political police.

The locus of power and political authority within Salazarism rested always with the dictator and the government, who made the great majority of decisions. In several of the other fascist era dictatorships, single parties functioned as parallel political apparatuses. This never happened in Portugal: here the political control was mainly effected through administrative centralization, the political police, censorship, and the corporatist apparatus, rather than by the single party.

The relationship between Salazar and his ministers was typified by the concentration of decision-making authority in the hands of the former, and the decrease of the latter's autonomy. Moreover, Salazar also reduced the President's independence and denied the National Assembly any supervisory control over the government. The dictator effectively eliminated the Council of Ministers (Cabinet), which was soon substituted by meetings with individual ministers. Cabinet meetings had become purely symbolic by the mid-1930s, only taking place when there were foreign and domestic policy problems that deserved to be shared with the nation, or when there were important Cabinet reshuffles. The tradition of collective ministerial dismissals was also abandoned in 1936 when Salazar began to replace up to one-third of his ministers every three to four years.

The centralization of power and the increasing number of organizations that were directly dependent from Salazar led to the creation in 1938 of an institution designed specifically to support

the Prime Minister: the Presidency of the Council of Ministers. "Rather than being just the inevitable consequence of an expansion of the State, this concentration of power was a guiding principle of the regime, controlling the departmental bureaucracy" (Lobo: 2001, 71). It was not until 1950 that Salazar created a Minister of the Presidency of the Council of Ministers, to whom he began to delegate some responsibility for the co-ordination of the government. The least important ministers practically ceased to have any direct contact with the dictator from this point. The initial Ministers of the Presidency included some of the regime's most notable figures, including Salazar's successor, Marcello Caetano, who used this office to create important networks of influence. In 1961, Salazar began cautiously to reduce the status of this portfolio, and chose less 'political' personalities to occupy the office – a practice that was continued by his successor.

The 'technical' legitimacy of the ministerial function was a constant theme of the dictator's discourse: the true political areas of the regime were not initially elevated to ministerial rank, remaining dependent on the Prime Minister. This was the case with the National Propaganda Secretariat (*Secretariado de Propaganda Nacional* - SPN), for example, which was promoted to ministerial status as the Ministry of Information and Tourism only after it had been depoliticized. Salazar's official discourse was that despite "politics, as a human art [being] forever necessary as long as mankind exists; government ... will increasingly be a scientific and technical function" (Nogueira, 1978, 290).

It is not surprising that the New State has been characterized by the long time that ministers served in office: one-quarter remained in government for more than eight years, while another one-quarter retained their positions for between four and eight years (see Table 4). The lack of mobility through ministerial portfolios is also remarkable (see Table 5), suggesting the progressive nomination of specialists for those portfolios. Salazar loosened his hitherto iron grip on government, largely as a consequence of the outbreak of the Colonial Wars in 1961, and increased the independence granted to the more technical ministries, which allowed him to concentrate his efforts in defense and foreign policy matters.

Reflecting the expansion of the administration, and its extended control, there was a concomitant increase in the size of the government that was shown through the creation of an ever greater number of Secretaries and Under-Secretaries of State. These positions were to become a fast track to ministerial careers, as we shall see below. Centralization of the public administration was accentuated during Salazar's regime, and the stability of appointments to the bureaucratic elite was a characteristic of his rule. Signs of change only began to appear towards the end of the 1960s with Caetano's attempts at technocratic modernization.

Salazar's substitution by Marcello Caetano in 1968 heralded a significant renewal of the dictatorship's political elite. Caetano replaced a large number of Salazar's ministers, reorganized the single party by introducing younger blood, and outlined his proposals for administrative modernization that included increases in the technocratic component within government. The increased degree of 'limited pluralism' within some of the regime's institutions was apparent, particularly within the National Assembly which was opened to a small 'liberal' sector.

Portugal's transition to democracy began with a military coup on April 25, 1974. Occurring at the height of the Cold War, when there were no great international pro-democracy pressures, the rupture provoked by the Portuguese 'Captains' led to an accentuated crisis of the state that was driven simultaneous by the movement towards metropolitan democracy and the decolonization of Europe's last empire.

The most complex phase of the democratization process took place between 1974 and 1976, the year in which the new Constitution was approved, and in which the first legislative and presidential elections took place. The divisions that arose as a result of decolonization – the initial cause of the conflict between the captains who led the coup and the conservative generals – stressed the political role played by the Armed Forces Movement (*Movimento das Forças Armadas* – MFA), while clearing a space for the political and social mobilization that produced the crisis of the state: "at that moment, Portugal experienced the most intense and sweeping mobilizations of all the new

democracies' (Schmitter, 1999: 360). As one analyst of the Portuguese transition has noted, the crisis of the State was a 'window of opportunity' for the radicalization of the social movements, one that should not be ignored in any analyses of this period (Muñoz, 1997). It was in this context of powerful social and political mobilization (with nationalizations, agrarian reform of the large southern *latifundia*, the occupation of urban buildings, and a strong military presence in political life and in the regulation of the social conflict) that the moderate political parties, in alliance with members of the military, defeated the radical left and their military allies.

Alone out of the four principal founding parties of Portuguese democracy, the Communist Party (*Partido Comunista Português* – PCP) had a long history of clandestine organization within the country. The Socialist Party (*Partido Socialista* – PS), which was founded by Mário Soares in West Germany in 1973, was heir to the republican and socialist elements of the electoral opposition to Salazarism. The remaining two center-right parties were only formed in 1974: the Social Democratic Party (*Partido Social Democrata* – PSD), founded by the 'liberal wing' that emerged during the last phase of the authoritarian regime; and the Social Democratic Centre (*Centro Democrático e Social* – CDS), a Christian liberal conservative party that was on the verge of being proscribed in 1975 (Bruneau, 1997; Frain, 1998). In an atmosphere of political purges and measures introduced to punish the authoritarian regime's political and administrative elites, the parties of the right were pressured not to accept leaders from the previous regime as their political programs shifted considerably to the centre and the left (Pinto, 2001).

The MFA's decision to respect the electoral calendar was the key element in the establishment of the democratic regime's founding legitimacy. Elections to the Constituent Assembly on 25 April 1975 gave the moderate parties powerful leverage. The PS won with a working majority, followed by the PSD; the PCP, however, only obtained 12 percent of the vote. The d'Hondt system of proportional representation was adopted as a means to insure that the diverse range of political forces contesting Portugal's first democratic elections obtained representation without also leading to an excessive fragmentation of the party system.

There were six Provisional Governments between 1974 and 1976, each with representatives of the three main parties (PCP, PS and PSD). These Cabinets proved to be extremely unstable, as can be seen in their average duration of 4.3 months (see Table 2). As would be expected given the nature of the transition, there were no 'carry over' ministers, and military officers held several civilian ministerial portfolios; besides, two of the three Prime Ministers and the two Presidents of this period were also military. Nevertheless, the various pacts that were celebrated between the MFA and the political parties ensured the establishment of a democratic regime – even if it was to be supervised by the armed forces (Graham, 1992).

The moderate party elites who supervised the consolidation of Portuguese democracy had to cope with a complex heritage. The 1976 Constitution had a long ideological preamble that consecrated the revolutionary nationalizations and agrarian reforms, as well as the military's tutelary political presence with the institutionalization of the Council of the Revolution (*Conselho da Revolução* – CR), which retained important powers over the armed forces and functioned as a constitutional court. In an arrangement that was imposed by the MFA on the political parties, the CR was to be placed under the direct control of the President, who was also a military officer: in this case the leader of the coup that had contained the radical left.

The 1976 Constitution created a semi-presidential regime. Directly elected by universal suffrage, the President became both commander of the armed forces and the person to whom the government was politically responsible. He had the authority to dismiss parliament if the government did not have a stable majority, giving him the power to 'engineer a majority himself.' He also retained a pocket veto with which he could prevent any law from passing.

The period between 1976 and 1982, when the Constitution was revised to abolish the CR and reduce the President's powers, was one of heightened tension between the President and the political parties at a time when the PCP remained out of the government. The first years of democratic consolidation were dominated by unstable coalitions and three Presidential Cabinets. Those years

were of economic austerity during which agreements were reached with the International Monetary Fund (IMF). With the 1982 revision of the Constitution, the PS, PSD and CDS managed to secure governmental control over the armed forces, enhancing the role of parliament and removing un-elected military officers from important power positions. The political parties became increasingly dominant within the political arena. By 1985, all candidates contesting the Presidential elections were civilians, with Mário Soares, then leader of the PS, becoming the first democratically elected civilian President. While some analysts continue to believe that the President retains significant powers, the reality is that Portugal has come closer and closer to the model of a parliamentary democracy (Sartori, 1994).

Curiously enough, the emergence of a centrist party sponsored by President Ramalho Eanes during his second mandate, and which had been spectaculary (and ephemerally) successful at the 1985 election – winning 18.4 percent. of the vote – did not lead to a major fragmentation of the party system. Rather, it produced a shift towards a bipolar competition between the PS and the PSD, at the expense of both the PCP and the right-wing CDS. From 1987, when the center-right PSD led by Cavaco Silva formed a single-party government, the previous pattern of coalition governments came to an end, replaced by a series of single-party majority PSD (1987-1995) and PS (1995 to 2002) governments, "with a remarkable increase in cabinet durability not preceded by any change in electoral law" (Bruneau et al., 2001: 28).

Democratic consolidation, accession to the European Union (EU), economic development, and a new impulse for social change coincided during the 1980s in a 'virtuous circle' that linked the economy and politics (Maravall, 1997: 82). Accession to the EU was a policy shared by all parliamentary parties, with the exception of the PCP, and represented a new framework for both democratic consolidation and economic development. It was in this context that a second revision of the constitution in 1989 removed constitutional obstacles preventing the privatization of the substantial nationalized sector.

As mentioned above, Portugal has a long tradition of political and administrative centralization. If we exclude the grant of autonomy to the island regions of Madeira and the Azores through the creation of regional parliaments and governments in accordance with the 1976 Constitution, the new regime may be characterized as being a 'high unitarian democracy' (Diamandouros and Gunther, 2001: 20). Although regional identities are very feeble in metropolitan Portugal, proposals for the creation of semi-autonomous regions were included in the manifestos of the political parties as a decentralized device that would lead to administrative modernization and rationalization, and as a means of creating a greater opening towards civil society: however, it was a policy that neither governments of the left nor of the right were to implement. Accession to the EU in 1986 was to introduce a supplementary external spillover, particularly with the influx of Regional Development Funds. However, the persistence of complaints against regionalization from a part of the electorate led to the rejection of the proposal in a poorly attended referendum in 1998. Portugal thus continues to be one of the most centralized of all Europe's democracies. This is naturally reflected in the way in which public administration has developed. With democratization, state expenditure has risen substantially, largely as a result of its increased participation in the provision of health and education services and in the extension of social security – those services having been neglected by the previous regime (Maravall, 1997: 54-57). The growth of the central civil service has outstripped that of the local administration to the extent that around 83 percent of all public employees during the democratic period are employed by central government (Barreto, 1996).

WHO GETS TO POWER? THE SOCIAL BACKGROUND OF MINISTERS

Our study looks at all members of the Portuguese ministerial elite from May 1851 to October 1999. During this 148-year period, Portugal was governed by 118 Cabinets that incorporated a total number of 769 ministers (including seventy-two Prime Ministers).

The background information on the ministers was drawn from several printed sources (biographical dictionaries, official directories, newspapers, etc.) as well as from some primary source material that is available in historical archives, and was entered into a specially designed database. As regards the ministers of the democratic regime, a few personal interviews were also conducted in order to collect more detailed biographical data. Unfortunately, only a very small number of ministers have published autobiographies or memoirs, and there is a shortage of academic monographs on the lives of both past and present politicians – even the most prominent ones. The aggregate analysis of biographical data presented here is the first comprehensive empirical study on the composition and recruitment of the Portuguese ministerial elite, since the few quantitative works published on the subject are focused on specific chronological periods and use a limited set of background variables.

Age

During the last century and a half, and regardless of the political regime, the majority of first-time ministers fell into the forty to forty-nine age group, and their average age was either forty-six or forty-seven. The only exception to this pattern occurred during the Military Dictatorship, when the 'standard' age for entering the Cabinet was between fifty and fifty-nine, and the average age rose to forty-nine. This rise was caused by the fact that a substantial proportion of ministers were drawn from the senior hierarchy of the armed forces.

Table 6
Age distribution (%) and average age of ministers[*]

[*] Age at time of first appointment.

In terms of the age of first-time ministers, the Constitutional Monarchy occupies second position in the ranking, with 41.3 percent of first-time ministers being appointed after they had reached fifty years of age. The reasons accounting for this high proportion of ministers recruited in the oldest age groups are the significant presence of high ranking military officers, and the long parliamentary careers that many ministers enjoyed prior to their elevation to the Cabinet. The authoritarian New State was another regime in which seniority was valued, with almost 39 percent of all first-time New State ministers being appointed after their fiftieth birthday. It should be noted, however, that contrary to a popular belief, which is founded on the longevity of the Salazarist regime, Salazar's regular Cabinet reshuffles effectively prevented the formation of a gerontocratic authoritarian ministerial elite (Lewis, 1978).

In contrast, the First Republic and post-authoritarian Democracy account for the largest proportion of younger first-time ministers. As far as the latter regime is concerned, almost one-third of all first-time ministers during the transitional period (1974-76) were less than forty years of age when they were appointed. The youth of the new regime's 'formative elite' is also evident in the age distribution of the deputies elected to the Constituent Assembly in 1975, where 50 percent had not reached their fortieth birthday (Freire, 2001). This 'trend' was reversed during the period of consolidation, when the proportion of Cabinet beginners aged between thirty and thirty-nine declined to 23 percent. Nevertheless, the median age (forty-six years) of Portuguese ministers during the democratic period is lower than the average for all Western European democracies between 1945 and the mid-1980s, which Jean-Louis Thiébault refers as being forty-eight years (Blondel and Thiébault, 1991: 21, 71).

Geographical origins

Unlike in other southern European countries, regional identities in continental Portugal are weak and diffuse. They have neither been an important factor in Portuguese political life, nor have they led to demands for territorial autonomy. Consequently, in terms of geographical analysis, the contrast between urban and rural areas, and the specific role played by the largest cities is a more appropriate indicator than regional differentiation.

Taking information on places of birth into account, the most important observed trend throughout the period being studied is the predominance of Lisbon, and its over-representation despite some rather significant variations in magnitude between regimes. The proportion of ministers born in the capital city has varied between one-fifth and one-third of all ministers, while the city's population only reached a maximum of about 10 percent of the total population of the country. Most likely, metropolitanism – i.e. "the tendency for one or a few large cities to dominate the politics of a nation" (Frey, 1965: 131) – would be more accentuated when data on the previous place of residence of ministers become available. This seem to suggest the persistence of high levels of centralization in elite recruitment.

Since the mid-nineteenth century, and in contrast with the country's dominant demographic profile – in 1991, only 39.4 percent of the population were living in towns with more than five thousand inhabitants (Rodrigues and Pinto, 1997: 11) – the largest proportion of Portuguese ministers have been born in the major urban areas. This trend was reversed briefly during the First Republic, when a slight majority of ministers (52.1 percent) came from small towns and villages. A similar phenomenon had occurred with the establishment of the French Third Republic (Jean Estèbe, 1982), and in both countries it seems to be closely connected with the lower social status of the new ruling elite. In the present democratic regime the urban background of ministers has been clearly reinforced: nearly two-thirds of them were born in the major cities. The transition to democracy also brought a novelty: a sizeable minority of ministers (10 percent) of the provisional governments were born in the former African colonies, which by that time had achieved independence.

Educational credentials

Data on the educational background of ministers show a striking and persistent feature across regimes: almost all of them had either a university degree or had graduated in the military academies. In other words, ministers without higher education training were atypical.

The lowest proportion of those with higher education may be found during the Constitutional Monarchy (93.5 percent), and the highest during the authoritarian period (100 percent). This did not alter with democratization (see Table 8). Even within the left-wing parties, academic credentials have been an indispensable prerequisite for access to the most senior political positions. When we consider that in 1981 only 1.6 percent of the Portuguese population had a university degree (Barreto, 1996), it is undeniable that educational qualifications have acted as a powerful social mechanism restricting the range of elite recruitment. We should note that from 1945 to the mid-1980s, the overall proportion of university educated ministers in the older Western European democracies was 77 percent (Blondel and Thiébault, 1991: 21).

N=Number of ministers who completed their higher education studies.

The proportion of civilian ministers with a doctorate is also impressive, and reached its peak during the authoritarian regime (43.4 percent). As we shall see below, this accounts for the importance of university professors as a reservoir for ministerial recruitment.

Several aspects of the ministers' fields of higher education should also be mentioned. Training in the Military Academies was the dominant credential during the First Republic and, rather obviously, the Military Dictatorship, and the second largest academic background in both the Constitutional Monarchy and the New State. It was also prevalent amongst ministers during the transition to democracy in the mid-1970s. A decisive consequence of the consolidation of democracy was a break with this long tradition of military participation in political office.

Among civilian ministers, those holding degrees in law maintained the highest share throughout the entire period. Graduates in medicine had some relevance during the First Republic, but afterwards became increasingly marginal. Engineering emerged as the second largest discipline in the authoritarian period, and since 1976 it has seriously challenged the traditional hegemony of legal training.

In the Democratic regime there has been a clear diversification of expertise among members of Cabinet. Accompanying the rise in engineering graduates there has also been a rapid expansion in the number of ministers with degrees in economics and in management. This picture is congruent with the demographic trends in the professions: between 1970 and 1990, there was a steady growth in the number of engineers, and a remarkable increase in the number of economists (Carapinheira and Rodrigues, 2001: 132). Another distinctive trait of ministers' educational profile during democracy has been increased cosmopolitanism, with those taking their undergraduate and postgraduate degrees at foreign universities accounting for almost one-quarter of all ministers appointed since 1974. During the transition to democracy, the majority of those who had studied or taken degrees abroad had gone to France. Since 1976, however, the United Kingdom comes clearly ahead, and the predominant postgraduate qualifications taken there are in the academic fields of economics and engineering.

N=Number of known cases.

Two institutions dominated Portuguese higher education until the early decades of the twentieth century, and played a crucial role in the socialization and recruitment of future political leaders: the University of Coimbra, with its Faculty of Law; and Lisbon's Military School (*Escola do Exército*). The creation of faculties of Engineering and of Law in Lisbon during the First Republic contributed decisively towards reinforcing the capital city's status as a privileged location for university-level education. If the number of students of higher education in Lisbon represented less than 36 percent of the national total in 1900, by 1930, this proportion had risen to 51.7 percent, while the proportion studying at Coimbra fell from 44 to 28 percent over the same period (Oliveira Marques, 1991: 560). Data on the places of higher education studies of ministers confirms Coimbra's decline and Lisbon's rise, a trend that has been reinforced during the Democratic period. Whereas fifty-five percent of Constitutional Monarchy ministers received their higher education at Coimbra, only 13 percent of Democracy's ministers were graduates of that university, while an impressive 78.6 percent studied in Lisbon.

Occupational profile

Recruited from a highly educated middle-class, the majority of Portuguese ministers have also been drawn from a narrow professional range. Prior to the consolidation of contemporary democracy, the two most important occupational categories were the military and university professors. On the whole, the contingent of public employees has predominated, a characteristic that in part reflects the central role that the state has performed in the structuring of the occupational market, where it is the major employer in some professions. The ministerial elite's dependence on state employment (as is the case for other political officeholders), may be considered an indicator of weak elite autonomy (Etzione-Helevi, 1993).

N=Number of known cases.

The strong presence of the armed forces at the ministerial level is principally a result of their direct involvement in regime transitions and crises. During earlier periods, however, the military's involvement was also connected with their monopoly of technical expertise (in engineering, topography and mining, for example), which gave them an influential role in critical areas of state-building. It was not uncommon, for example, for ministers of Public Works to be recruited from the military during the Constitutional Monarchy. After the Great War the military's presence in government was exacerbated by their direct political interventions, which culminated in Military Dictatorship in 1926. With the consolidation of the New State, however, military ministers' numbers not only declined, but those who remained were appointed on the basis of more 'technical' criteria. If during the 1930s they could still secure such positions as the Interior Ministry, at a time when the state's repressive apparatus remained marked by its previous connection to the Military Dictatorship, from the early 1940s they were almost exclusively restricted to those ministries associated with defense and the colonies. The democratic transition of the mid-1970s saw the brief emergence of middle-ranking officers who had been politicized during the Colonial Wars. From 1976 on, the proportion of military officials within government declined dramatically, representing only 3.8 percent (see Table 9): by 1980 even the defense portfolio came to be occupied exclusively by civilians.

The importance of university professors (in particular, professors of law) is not in itself surprising, but it was during Salazar's regime that this numerically small body was to become the single major source of ministerial recruitment, and one that, at 33 percent (see Table 10), was significantly higher that the European average. Even when we limit our comparison to authoritarian regimes alone – and with Franco's Spain in particular – the difference is noticeable. Enjoying great social prestige, they were transformed into a 'super-elite,' sharing the leading positions within the state apparatus, government and the public economic sector between themselves. By the 1960s, for example, professors of law enjoyed greater prestige than leading industrialists (Makler, 1968). Another significant group of professors represented within Cabinet from the 1950s were those coming from the Faculty of Engineering who were associated with economic development and infrastructural modernization projects, and who occupied the Ministries of Economics, Commerce and Public Works.

University professors were to remain the largest single category of ministers in contemporary Portuguese democracy (32.1 percent), albeit with two significant differences from the authoritarian regime: (i) not all of them came from the highest ranks of the university profession, and (ii) law professors ceased to dominate. Many of the university elite that had been associated with Marcello Caetano (who was himself a law professor) were to play an important role during the first years of the democratic regime. Nevertheless, since 1976 engineers and, especially, economists were favored in the ministerial selection processes, provoking a relative decline in the number of law professors. This tendency was stimulated by the economic crises and the 1978 and 1982 IMF negotiations, and later by the demands of European integration.

The consolidation of democracy is associated with some important changes in the ministerial elite's occupational background, particularly with the reemergence of the liberal professions and of a large proportion of professional managers (24.5 percent). Lawyers were the dominant civilian element of the republican elite, followed by medical doctors (12.1 percent). If the former continued

to be an important source of recruitment of the political elite, the latter – a professional group that had typically been associated with political notables – have eclipsed as a result of increasing technical and state demands placed on the profession. Lawyers, given their protected position within civil society, constituted an important reserve of pro-democratic counter-elites during the authoritarian regime, and their return to the political elite was a natural consequence of the transition to democracy. In the democratic regime, lawyers have become one of the dominant professional groups within both the parliamentary and party elites. Their lesser importance within the ministerial elite, particularly when compared with the professional managers, can perhaps be attributed to the increasingly technical nature of ministerial functions since the 1980s, and the consequent need to recruit trained specialists.

If we look at the occupational distribution of ministers, we see that public employment is a structural characteristic of the Portuguese ministerial elite, peaking at 86.4 percent during the New State (see Table 9a). This trait, however, should not be confused with the presence of those with a purely bureaucratic background. The significant proportion of senior public servants in the democratic regime (13.2 per cent) includes managers of the state's regional development commissions – almost all of them engineers and economists.

Even under Salazarism it was the military and the university professors who constituted the majority of ministerial officeholders, with very few of the members of the bureaucratic elite actually obtaining ministerial rank. While simultaneously strengthening the government's political control over the judiciary – therefore reducing its formal autonomy – the New State also sought to prevent members of the judiciary from joining the regime's political institutions.

Both the First Republic and the present democracy were and are political regimes in which the occupational background of ministers has demonstrated the least dependence upon the State. In the former, this was due to the importance of liberal professionals, while in the latter, it is a result of the supplementary growth of both managers and economists within the private and mixed sectors of the economy.

The left-right cleavage – which in the Democratic period has been represented through the two main parties of government, the PS and the PSD – has not been translated into substantive differences with respect to the occupational background of their respective ministers.

Gender

It is only recently that Portuguese women have obtained political rights. Despite feminism having been a component in the republican movement at the beginning of the twentieth century, the First Republic denied women the right to vote. It was only in 1933, in Salazar's New State, that some women were enfranchised, albeit under conditions that were more restrictive than those that applied to men. Equal political rights, in the context of a reduced franchise, were only granted in 1969, with Marcello Caetano's arrival to power, on the basis of a report that stressed the usefulness in obtaining some more 'conservative' votes for the governmental party (Lucena, 1976). The first three women deputies entered parliament in 1934, having stood on the single party's list. The representation of women in parliament was to remain poor until the end of the authoritarian regime, and it was only during the 1960s that the first woman was to enter the government: as an Under-Secretary of State, however not as a minister.

The demands for women's political and civil rights were only met with the transition to democracy, and the question of the lack of women in the parties' leaderships, within parliament, and within the government only entered the political debate during the 1980s. With Portugal having one of the largest rates of female employment in western Europe since the 1960s, the contrast of this with the presence of women within the legislature and the executive is particularly noticeable (Barreto, 2000: 119).

While the number of women parliamentarians increased dramatically – from 5 percent in 1976 to 17 percent in 1999 – this increase has been driven more by the parties of the left than by

those of the right, with the PCP having the highest percentage of women deputies since 1976, followed fifteen years later by the PS, which has established an internal system that is designed specifically to increase the number of women candidates. The Portuguese case also seems to demonstrate that the closed party list system of proportional representation increases women's chances of entering parliament (Siaroff, 2000). During the 1990s, 12 percent of Portuguese deputies were female – a figure that is only slightly below the EU average (Viegas and Faria, 2000) – although the indicators showed that 'civic and political demobilization' of women remained high (Cabral et. al., 1993). A moderate proposal advanced by the PS, which sought to establish gender quotas for candidates to Parliament, was rejected in 1999 as a result of opposition from both the parties of the right and the PCP, thereby demonstrating elite resistance towards a culture of 'parity' through positive action.

The number of women (seven) in the Portuguese ministerial elite is very small, accounting for less than 4 percent of the total number of ministers between 1974 and 1999. The first woman to become a member of the executive was Maria de Lourdes Pintasilgo, an independent who was appointed Minister for Social Affairs in July 1974, and who later led one of the governments appointed by President Eanes in 1978.

The more significant increase in the number of female Secretaries of State improved the overall average to 8 percent at the beginning of the 1990s if we consider all members of government and not only ministers. The rate of increase has been irregular, however, as no political party has a specific policy aimed at increasing women's participation in government. It only really became noticeable when in 1995 the PS, after 10 years of center-right governments, nominated a government in which 15.8 percent of the members were women – although this proportion was to decrease following the first government reshuffle (Viegas and Faria, 2000: 27). The creation of a Ministry for Equality in 1999 was also a PS initiative, albeit a short-lived one, as the ministry was soon dissolved.

If the left-right division may be a reasonable explanation for the variation in the number of women in Parliament, the same cannot be said for the ministerial elite. Moreover, and like it happens in other European democracies, 'specialist recruitment patterns' appear to have been the most important ones for enabling women to enter government (Davis, 1997).

POLITICAL PATHWAYS TO THE CABINET: THE MAIN CAREER PATTERNS

The main career path leading to the Cabinet during the Constitutional Monarchy was through Parliament, with the overwhelming majority of ministers having had previous legislative experience (87.1 percent), either as deputies (82.6 percent) or as peers (21.3 percent) (see Table 10). Former deputies with long parliamentary careers were more common within ministerial ranks: more than two-thirds of ministers had served three or more terms in the legislature (see Table 10a). The fact that a successful political *cursus honorum* required many years of parliamentary service is clearly stated in the memoirs of many liberal politicians of the time (Cayolla, 1928; Cabral, 1930). The small number of ministers who were not recruited from Parliament were mostly military officers.

For the majority of ministers, serving in Parliament was the starting point of their route to Cabinet. Most likely as a consequence of traditional administrative centralization, positions in local administration were not perceived as promising routes for the progression of political careers. The figures confirm this belief, with only approximately 10 percent of Cabinet members having served as mayors at an earlier stage in their career. The empirical evidence that is available on Parliamentary deputies during the late nineteenth century reveals how few of them had previously served as either mayors or as local councillors (Almeida, 1995). As for the position of Prefect – a position that was crucial in the intermediation process between national and local politics – this was an important springboard to Cabinet office, which one-fifth of ministers utilized, although it should be noted that most of these men had also served as Parliamentary deputies or as Peers.

Although poorly organized and riven with personisms and factions, the two major parties played an increasingly important role in the electoral and parliamentary arenas from the late 1870s, and controlled the major routes to power. The chances for aspiring politicians to obtain Cabinet rank were therefore greatly enhanced if they associated themselves with one or other of these parties: the proportion of ministers with political affiliations was very high. However, it is difficult to know with certainty how many ministers had been party leaders, particularly given the low level of formalization of party structures (see Table 11). Leadership experience gained in one of the organized interest groups was confined to a small number of ministers (7.8 percent).

We should also note that the impact of secret organizations and of informal relationships in the selection and reproduction of the elite is difficult to assess, although it is an aspect that should not be neglected. Thirty ministers (17.2 percent) were Freemasons, while family and kinship relationships also played a part in both parliamentary and ministerial recruitment: relatives were often elected in the same constituency and appointed to the same ministerial portfolios (Almeida, 1991; 1995).

N=Number of all ministers, except during the Constitutional Monarchy. For this period only those ministers first appointed after 1 May 1851 have been included.
[*] Before their first appointment to Cabinet. Multiple coding has been applied when minister have held different political office, therefore percentages do not total 100.
[1] The post of Secretary of State, a provisional creation of the First Republic (1916-17), became a permanent office dating from the early years of the New State.
[2] Individuals who had been ministers during the previous period.
[3] Includes 14 individuals who were ministers during the transition to democracy (1974-76), and one who was a minister in the last cabinet of the New State.

Table 10a
Ministers' previous parliamentary experience (%)*

Number of times elected to parliament	Constitutional Monarchy	First Republic	Military Dictatorship	New State	Democracy	
					74-76	76-99
1	13.3	53.7	42.8	61.3	100.0	38.0
2	18.0	26.5	42.8	22.6	0.0	40.5
3	19.5	10.5	14.3	9.7	0.0	10.7
>3	49.2	9.3	0.0	6.4	0.0	10.7

N=Number of all ministers, except during the Constitutional Monarchy. For this period only those ministers first appointed after 1 May 1851 have been included.
[1] Refers only to the regime's single party (National Union, which was founded in 1930 and renamed National Popular Action in 1969), and thus excludes any party leadership positions held prior to the authoritarian period.

The change of regime from the Constitutional Monarchy to the First Republic had two main effects on the pattern of ministerial recruitment. On the one hand, the proportion of ministers with parliamentary experience dropped sharply, from 87.1 percent to 67.5 percent (see Table 10). Moreover, while during the Monarchy there was a high proportion of ministers with long parliamentary careers, in the First Republic, the proportion of ministers who had been elected to parliament only once increased dramatically to 53.7 percent (see Table 10a). This suggests that there was a high turnover of both parliamentarians and ministers: an intense elite circulation that provided more opportunities for those aspiring to political office. On the other hand, the proportion of Cabinet members appointed without previously holding political office increased from 6.4 percent to 20.2 percent, a trend that was largely the result of the consolidation of an alternative route to power: the armed forces. It is also worth noting that it is in the First Republic that we find the highest proportion of ministers with prior service as mayors and councillors (13.2 percent).

The political parties of the First Republic, and the dominant Democratic Party in particular, played an active role as the gatekeepers of elite recruitment. With the exception of some military officers and a few civilians, ministers were usually affiliated to a political party, and at least 20 percent of them had previous party leadership experience. Freemasonry, which had close links with the Democratic Party, was a major source of recruitment to the ministerial elite, providing a total of eighty-nine, or 36.6 percent, of all Cabinet members. In contrast with the Monarchy, political endogamy was rare within the Republic.

Salazarism, as an authoritarian regime with a weak single party, adopted a much more 'bureaucratic' channel of elite recruitment. Only 31.1 percent of Salazar's ministers were either national or regional UN leaders (see Table 11), and around one-half were not even members of the

party (Cruz, 1988). Compared to the other dictatorships of the 1930s – Italian Fascism or Francoism, for example – we see that the Portuguese regime's party was much weaker and did not monopolize the selection of the ministerial elite. As Clement Moore noted: "The party cannot establish its legitimacy, it would seem, unless it acquires some autonomy as an instrument for recruiting top political leaders. Thus dictators who attain power through other bases of support often have difficulties creating a party to legitimate their regimes" (Moore, 1970: 51).

Salazar created the UN, but gave it only a limited role. Promotion to governmental positions via the leadership cadres of either the militia or the paramilitary youth organization, the *Legião* and the *Mocidade* respectively, was even less likely. The UN played a significant role in the selection of deputies to the National Assembly, and it was within this institution that the greatest equilibrium between the regime's informal 'political families' – the Catholics, monarchists, and republicans – was to be found (Carvalho, 2002).

There was a great stability in the New State's ministerial elite recruitment methods. A large proportion of the regime's civilian Cabinet ministers had initially served as Secretaries and Under-Secretaries of State (34 percent), had been deputies to the National Assembly (30.1 percent), or had served as procurators in the Corporatist Chamber (25.2 percent). An increasing number of ministers emerged with no previous history of involvement in any of the regime's institutions (28.1 percent: see Table 10). This proportion was not to change much over time, and remained significant even within Marcello Caetano's two ministries (Castilho, 2001; Carvalho and Fernandes, 2002).

During the New State, the most important ministerial portfolios were clearly controlled by a small group of dignitaries, or 'notables,' who belonged to the leadership of the single party, and also occupied senior positions in the public administration and the universities. Several of those UN ministers had also been deputies to the National Assembly. Participation in the single party was, therefore, "quite helpful [when] combined with other qualifications… [such as] a brilliant academic or civil service career, and identification with other groups" (Linz, 1976: 184). The Portuguese case seems thus to confirm Linz's thesis that when the single party is weak, the chances of ascending to the governing elite are slight "without [first] belonging to a senior administrative body" – in such cases the party is only a supplementary guarantee (Linz, c.f. Pi-Suner, 1978, 184).

During its first phase, the New State strengthened the role of the prefects to such an extent that they became the single party's main organizers during the 1930s. In association with the UN, they controlled all mayoral nominations, and were important instruments for controlling local politics – especially in the organization of 'elections.' The majority of prefects were members of the armed forces until the end of the 1930s: afterwards civilians came to dominate, as the Prefecture was perceived to be a good launching pad for obtaining a position in the National Assembly, although it rarely led to a ministerial appointment.

Nominations to the Corporatist Chamber (*Câmara Corporativa*), representing the nation's 'organized interests,' was the responsibility of a state council, which the Dictator presided over until the 1950s – although the creation of the various corporations thereafter made very little change to the proceedings. Being the more 'technical' chamber of the New State's bicameral legislature, a 'limited pluralism' of interest group representation was permitted. Given the nature of the 'reports' that the Chamber had to produce, the presence of university professors and senior members of the administration was common in some of its commissions. Unsurprisingly, one-quarter of the ministers were then drawn from the Corporatist Chamber. Progression through the offices of Secretary and Under-Secretary of State was also to become a privileged route towards membership of the ministerial elite: one that a significant proportion, around one-third, of ministers had followed.

Following the 1974 coup, a large group of military officers, lacking any real political experience, controlled important ministerial portfolios in the Provisional Governments. The first civilian ministers were well-known members of the democratic and communist opposition, however, and most of them had served long political apprenticeships in the regime's prisons or in forced exile. Some of the leaders of the right-wing parties had also been actively involved in politics,

particularly during the final years of the regime, when they were members of the 'reformist' groups that had initially supported Caetano.

Since 1976, a parliamentary career has become the single most important path to ministerial office once more. Another significant type of political experience of ministers, which often goes together with a representative background, has been holding a position as Secretary or Under-Secretary of State. While still corresponding to a minority of cases, membership in a *cabinet ministériel* (i.e., the staff who directly assists a minister) has been a promising springboard for those aspiring to ministerial office (see Table 10). Almost one-half of all ministers have had partisan leadership experience, either at the national or regional level (see Table 11). Local political careers are still not favored routes to reach ministerial office, which is in contrast to the situation in most West European democracies, where the average proportion of ministers who have been involved in local and regional politics is around 50 percent (Thiébault, 1991: 34). With democratization, prefects have become increasingly irrelevant as they have progressively been dominated by local branches of the national governing party. Also, between 1974 and 1999 only a few ministers (4.9 percent) had previously served as local councillors (but none of them as mayors). Nevertheless, the importance of elected local officials is increasing in the selection of the national political elite. The reinforcement of local autonomy and the increased financial muscle of many of the larger local authorities that has come about as a consequence of EU membership, is changing the image of local government. The symbolic prestige of the mayor's office in both Lisbon and Oporto has been enhanced during the late 1990s, mainly as a result of the 1996 election of the former mayor of Lisbon, Jorge Sampaio, as President of the Republic. A growing number of parliamentary deputies, 20.4 per cent, also have been elected after having served an 'apprenticeship' in local government (Magone, 2000).

It should be stressed that the number of ministers with a parliamentary background, accounting for approximately 51 percent, is much lower than the Western European average of around 75 percent (Winter, 1991: 48). With respect to the length of parliamentary service, we note that a large proportion of those who were deputies (38 percent) were elected only once, some of them having never actually served in Parliament due to their receiving promotion to the Cabinet within a matter of weeks after their election. Even the assumption that "prime ministers and deputy prime ministers are more likely to be parliamentarians" (Winter, 1991: 62), must be treated with caution in Portugal's case.

Two factors may have contributed to the reduced number of ministers with parliamentary experience in the Democratic period. On one hand, the party leaders who have been appointed to the position of Prime Minister have always enjoyed a great deal of autonomy in the selection of their ministers (Silva, 2002). On the other, the parliamentary groups have tended to occupy a subordinate position within the party's internal power structures. Additionally, it is significant that once the parties obtain power, it is normal for them to effect a 'governmentalization' of their leaderships through the control exercised over them by ministers who also hold key positions within the party leaderships (Lobo, 2002).

The relative devaluation of a parliamentary background in ministerial careers is undoubtedly related to the elevated number of technocrats and independents having little political experience, who have served in the governments of the Democratic period – particularly in the more technical portfolios. In fact, almost one-quarter (23.3 percent) of ministers have not held any political office prior to their appointment. During the early period of Portugal's democratic consolidation, the semi-presidential nature of the political system (which was later reformed) favored the formation of presidential ministries peopled by independent personalities. However, the recruitment of the latter has also been promoted by the parties, with a view to increasing their political legitimacy and the technical efficiency of their governments. This is, in part, symptomatic of a structural fragility of parties in democratic Portugal: despite their protagonism on the political stage, parties' roots are shallow, and their penetration in civil society is weak.

CONCLUDING REMARKS

Regime changes in modern Portugal were generally violent processes with an abrupt rupture, both from the previous political institutions, and from its underlying values. The military were key actors in most regime changes and political crises, and therefore an important source of recruitment of the governing elite.

Except for the transition from the Military Dictatorship to Salazar's New State, every regime transformation also brought about a radical alteration in the membership of the governing elite. As Mattei Dogan and John Higley have noted, "in many regime changes the entire group of uppermost political rulers is replaced, while the turnover of political elites at middle levels is more limited" (Dogan and Higley, 1998: 21). In Portugal, however, regime changes have propelled an extensive replacement of political personnel at different levels – from ministers and parlamentarians, to prefects and other middle-ranking officials. In some cases other institutions and elite groups were affected, and not solely those occupying formal leadership positions in the previous regime. In this respect, the greatest rupture with the past undoubtedly occurred during the mid-1970s' transition to democracy, when the nature of change also affected several members of the social and economic elites.

Nonetheless, as regards the configuration of the ministerial elite, we find significant continuities over the whole period studied here. Overwhelmingly recruited among middle-aged men from a highly educated middle class, Portuguese ministers prove to have formed an 'elitist' group drawn from a very narrow professional spectrum. Moreover, this image remains constant across party lines. The two single most important occupational categories, until the consolidation of contemporary democracy, were military officers and university professors. Lawyers and other liberal professionals – medical doctors, etc. – only gained some importance during the First Republic. On the whole, professionals working in the public sector have been the majority. The consolidation of democracy during the 1970s is associated with one important change in the occupational background of the ministerial elite: the reemergence of liberal professionals, and the appearance of a large number of managers.

As far as the political *cursus honorum* of Portuguese ministers is concerned, two characteristics are worth while noting: the persistence of the relative unimportance of local politics; and, as a secular trend, the declining role of parliamentary experience. In Portugal, unlike in many of the other Western European countries, there is a long tradition of separation between politics at the national and the local levels. Consequently, local politics has never been a promising route to ministerial office. Prior to the authoritarian period, parliamentary experience was regarded as an essential prerequisite for a ministerial career – at least for civilians. The contemporary democratic regime, however, has not clearly resumed this tradition of the liberal past, while it has favored the enhancement of more technical credentials and technocratic backgrounds in ministerial recruitment. As the comparison with other European democracies reveals, this tendency does not arise only from the growing complexity and technical character of policymaking; among other factors, it is also connected with the weak penetration of parties in civil society.
